About This Document

This document is written by EnGenius Inc. EnGenius Inc. the reserves the right to change this document without notice and all rights are reserved. This document can only be used for the configuration of EnGenius products.

This document is to characterize the EnGenius ENH202 Wireless Access Point & Client Bridge. Please read the document carefully before setting up the ENH202. Any damage which is caused by inappropriate use will not be covered under the warranty.

Formats

This document uses following symbols to indicate and highlight special messages.

	Caution: This symbol represents a vital message and it is critical for the device or settings.
	Note: This symbol represents an important message for the settings.
	Tip: This symbol represents an alternative choice that can save time or resources.

Before you start

The following equipment is required to setup the ENH202:

1. (1) Computer/Notebook and Internet access.
2. (2) Ethernet cables.
3. (1) EnGenius ENH202.

 The equipment listed above is only for configuration of the ENH202, you will need additional equipment to connect to the Internet and configuration will depend on your current network infrastructure. Please refer to Chapter 2 for more information.

1 Product Overview

Thank you for using the ENH202. It is a powerful and enhanced business-class product with 4 multi-functions: Access Point, Client Bridge, WDS, and Client Router.

EnGenius' ENH202 uses the latest wireless standard, 802.11n, which allows for faster wireless throughput. The ENH202 affords a great advantage to minimize the time and cost which is required to expand your network. It operates at 2.4GHz and is also backwards compatible with 802.11b/g networking equipment.

The ENH202 is easy to install almost anywhere with included proprietary Power over Ethernet adapter for quick outdoor installation. In addition, the ENH202 can manage power level control, and it features narrow bandwidth selection, traffic shaping and real-time RSSI indication. The ENH202 fully supports wireless encryption including Wi-Fi Protected Access (WPA-PSK/WPA2-PSK), (64/128/152)-bit WEP Encryption, and IEEE 802.1x with RADIUS. Additionally, the ENH202 is an ideal choice to pair with the ENH202 in an Access Point – Client Bridge or WDS Bridge – WDS Bridge topology.

The ENH202 utilizes a proprietary PoE adapter. Only use the supplied PoE adapter. Damage may occur if another PoE adapter is used.

1.1 Features

The following list describes the design and scope of the ENH202 made possible through the power and flexibility of wireless LANs:

a) **Difficult-to-wire environments**

There are many situations where wires cannot be laid easily. For example, historic and older buildings as well as open areas and cross-street architectures make the installation of LANs either impossible or very expensive.

b) **Temporary workgroups**

Consider situations in parks, athletic arenas, exhibition centers, disaster-recovery, temporary offices and construction sites where one wants a temporary WLAN established and removed at a future date. The ENH202 is easy to place into and remove from production.

c) **The ability to access real-time information**

Doctors and nurses, point-of-sale employees, and warehouse workers can access real-time information while dealing with patients, serving customers, and processing information.

d) Frequently altered environments

Show rooms, meeting rooms, retail stores, and manufacturing sites are prime examples where frequently rearranged workplaces are suited for wireless LANs.

e) Wireless extensions of Ethernet networks

Network managers in dynamic environments can minimize the overhead caused by moves, extensions to networks, and other changes by utilizing wireless LANs.

f) Wired LAN backup

Network managers may implement wireless LANs to provide redundancy for mission-critical applications which are implemented on wired networks.

g) Training and educational facilities

Training sites at corporations and students at universities use wireless connectivity to afford access to information, information exchanges, and learning.

Features	
High Speed Data Rate Up to 300 Mbps	Capable of handling heavy data payloads such as HD video streaming
High Output Power - up to 29 dBm	Extended range and excellent coverage
IEEE 802.11b/g/n Compliant	Fully interoperable with IEEE 802.11 b/g/n compliant devices
Multi-Function	Users can use different modes in various environments
Support RSSI Indicator (CB mode)	Users can select the best signal to connect with AP efficiently
Power-over-Ethernet	Flexible Access Point locations and cost savings (*Note: The ENH202 includes a proprietary PoE adapter.)*
Support Multi-SSID function (4 SSID) in AP mode	Allow clients to access different networks through a single access point and assign different policies and functions for each SSID
WPA2/WPA/ WEP/ IEEE 802.1x support	Full support for all types of current wireless security standards
MAC address filtering in AP mode	Ensure secure network by enforcing network access control lists
PPPoE/PPTP function support (AP Router/CR mode)	Easy to access Internet via ISP service authentication
SNMP Remote Configuration Management	Allow administrators to remotely configure or manage the Access Point.
QoS (WMM) support	Enhance user performance and density

1.2 Benefits

Access Point Mode	Use this feature to setup the access point's configuration information. It supports transmit power and channel adjustments. Clients can access the network with different regulatory settings and automatically change to the local regulations.
Client Bridge Mode	Use this feature to connect to an Access Point, enabling WAN sharing.
WDS Mode	Use this feature to link multiple APs in a network; All associated clients from any AP can communicate with each other like in ad-hoc mode.
Client Router Mode	Clients connect wirelessly to an AP and transmit data through AP to access the Internet.
Multiple SSIDs	ENH202 supports up to 4 SSIDs on your access point. The following options can be set to each SSID: - Public or private SSID - Authentication - VLAN identifier - RADIUS accounting identifier - Profile isolation for infrastructure network
VLAN	Specify a VLAN number for each SSID to separate the services among clients.
QoS	Use this feature to limit the incoming or outgoing throughput.
Wi-Fi Protected Access	Wi-Fi Protect Access is a standard-based interoperable security enhancement that increases the level of data protection and access control for existing and future wireless LAN systems. It is compatible with IEEE 802.11i standard. WPA leverages TKIP and 802.1X for authenticated key management.

1.3 Package Contents

Open the package carefully, and make sure that none of the items listed below are missing. Do not discard the packing materials; in case of return, the unit must be shipped in its original packaging.

- **(1)** Wireless Access Point / Client Bridge (ENH202)
- **(1)** 24V/1.0A Power Adapter
- **(1)** PoE Injector (EPE-24R)
- **(1)** Mounting Kit with Mast-Mount Strap Special Screw Set
- **(1)** QIG
- **(1)** CD (User Manual)

Using a power adapter other than the one included with the ENH202 may cause damage to the device.

1.4 System Requirement

The following conditions are the minimum system requirements.

- A computer with an Ethernet interface and operating under Windows XP, Vista, 7 or Linux.
- An Internet browser that supports HTTP and JavaScript.

1.5 Hardware Overview

Physical Interface	- 1 x 10/100 LAN Port with PoE support - 1 x 10/100 LAN port - 1 x Reset button
Maximum Wireless Data rate	- 300 Mbps
LEDs status	- Power Status - LAN (10/100Mbps) - WLAN (Wireless is enabled) - 3 x Link Quality (Client Bridge mode)

1.6 Understanding the ENH202 LEDs

The rear of the ENH202 has two groups of LEDs. One group, labeled **INDICATORS**, shows the status of the device. The second group, **LINK QUALITY**, shows the strength of the link between the ENH202 and the network. The following table describes the ENH202 LEDs.

LED	Color	Mode	Status
Power	Green	OFF= ENH202 is not receiving power. ON= ENH202 is receiving power.	
LAN	Green	OFF = ENH202 is not connected to the network. ON = ENH202 is connected to the network, but not sending or receiving data. Blink = ENH202 is sending or receiving data.	
WLAN	Green	Access Point or Client Bridge Mode	OFF = ENH202 radio is off and the device is not sending or receiving data over the wireless LAN. ON = ENH202 radio is on, and the device is not sending or receiving data over the wireless LAN. Blink = ENH202 radio is on, and the device is sending or receiving data over the wireless LAN.
Link Quality	See Status column	Access Point or Client Bridge Mode	Shows the strength of the link between the ENH202 and the network. G = good quality (green). Y = medium quality (yellow). R = poor or no link (red).

2 Installation

This chapter describes how to install the ENH202.

NOTE Only experienced installation professionals who are familiar with local building and safety codes and, wherever applicable, are licensed by the appropriate government regulatory authorities should install the ENH202.

2.1 Pre-installation Guidelines

Select the optimal locations for the equipment using the following guidelines:

- The ENH202 should be mounted on a 1"- 4" pole. Its location should enable easy access to the unit and its connectors for installation and testing.
- The higher the placement of the antenna, the better the achievable link quality.
- The antenna should be installed to provide a direct or near line of sight link with the base station antenna. The antenna should be aligned to face the general direction of the base station.

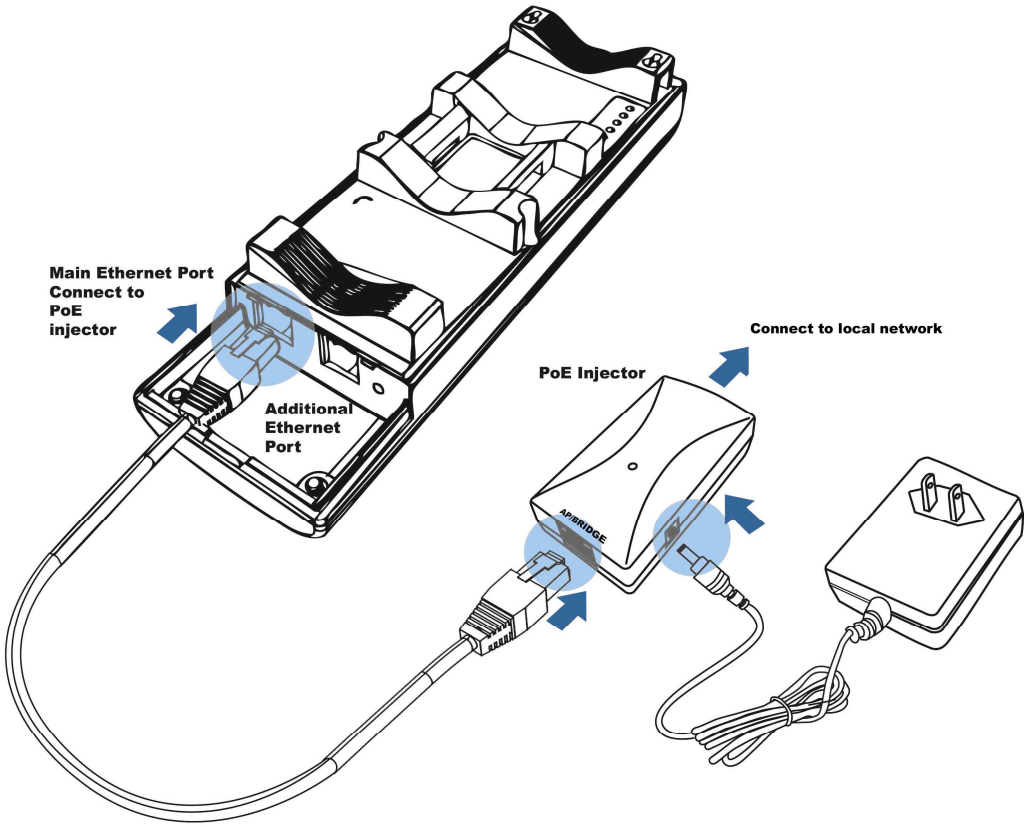
2.2 Installing the ENH202

To install the ENH202, use the following procedure to mount the device on a pole and refer to the figure below.

1. The bottom of the ENH202 is a removable cover. Grab the cover and push down slightly while pulling it backward to remove the cover.
2. Insert a standard Ethernet cable into the RJ-45 port labeled **MAIN LAN**.
3. Slide the cover back to seal the bottom of the ENH202.
4. Remove the power cord and PoE injector from the box and plug the power cord into the DC port of the PoE injector.

CAUTION **Only use the power adapter supplied with the ENH202. Using a different power adapter might damage the ENH202.**

5. Plug the other side of the Ethernet cable in Step 3 into the PoE port of the PoE injector. When you finish Step 5, the installation will resemble the following picture.



6. Turn over the ENH202. Then insert the mast strap through the middle hole of the ENH202. Use a screwdriver to unlock the pole-mounting ring putting it through the ENH200.
7. Mount the ENH202 securely to the pole by locking the strap tightly.

This completes the installation procedure.

3 Wireless Network Modes

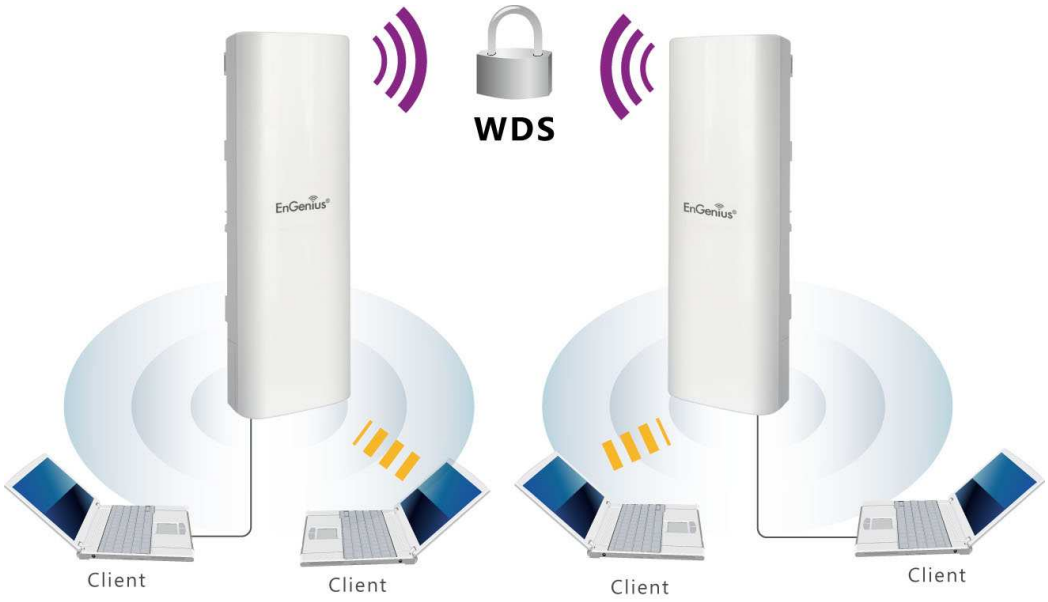
3.1 Access Point Mode

In the Access Point Mode, the ENH202 functions like a central connection for any stations or

clients that support the IEEE 802.11b/g/n standards. Stations and clients must utilize the same SSID and Security Password to associate while within range. The most suitable topology for this mode is to have one ENH202 as an AP and the second one as a Client-Bridge – when necessary a third Client-Bridge can be place within the directional antenna's path. One advantage of using the ENH202 to create point-to-point outdoor wireless links is when the environment is prone to radio interference on 5GHz band. Running the network on 2.4GHz can avoid the interference, thus providing higher stability to the network.

3.2 Access Point with WDS Function Mode

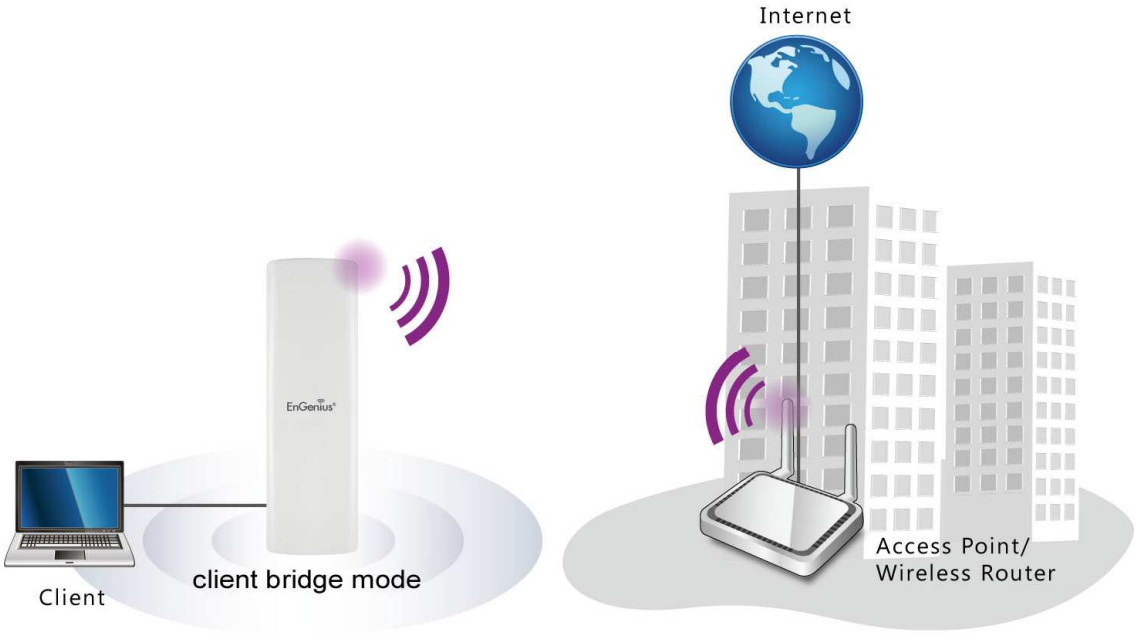
The ENH202 also supports WDS functionality while in Access Point Mode. Simply configure other Access Points and the associated MAC addresses in order to enlarge the wireless area by enabling WDS Link Settings. WDS functionality can support up to 8 different AP MAC addresses. Please note that this mode is rarely used due to the nature of directional antennae. Consequently, the wireless clients need to be located in the path of the ENH202's directional antenna and be within in the range to send signal back to the ENH202.



Not every Access Point supports WDS in Access Point Mode. It is recommended to use ENH202s if you would like to utilize this functionality.

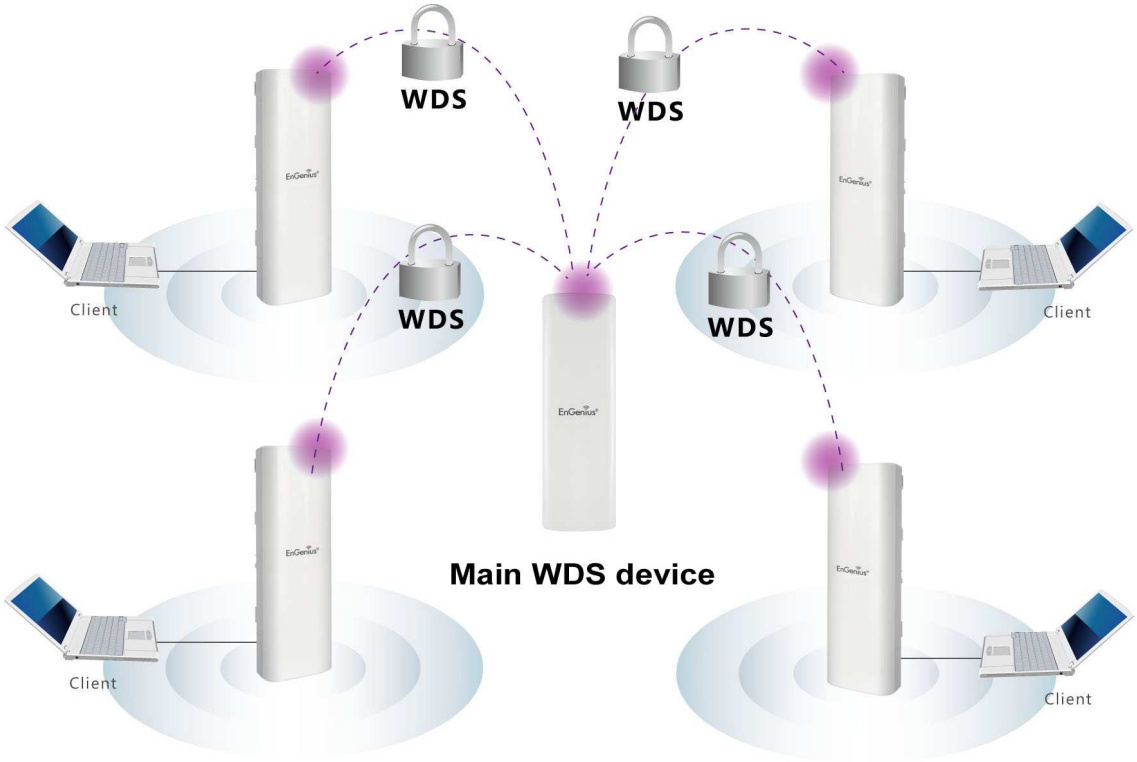
3.3 Client Bridge Mode

In the Client Bridge Mode, the ENH202 functions like a wireless client, connecting to an Access Point wirelessly and enabling Internet connectivity wherever you want. Use Site Survey function to scan all of the Access Points within range and configure the SSID and Security Password to associate with it. With Client Bridge Mode, the ENH202 works as long range 2.4GHz wireless-Ethernet Bridge in order to provide a 2.4GHZ link between the access point and networked clients.



3.4 WDS Bridge Mode

In the WDS Bridge Mode, the ENH202 can wirelessly connect different local area networks by configuring each device's MAC address and security settings. The WDS Bridge Mode can bridge up to four local wired networks together as one logical network. Every computer on this logical network can see each other, sharing files as if they are in the same location. With 600mW output power and MIMO antenna technology, the connection distance can extend beyond 1000 feet with good performance, assuming the antenna are within line of sight. The WDS bridge network is a MAC-based network that provides transparent bridging.

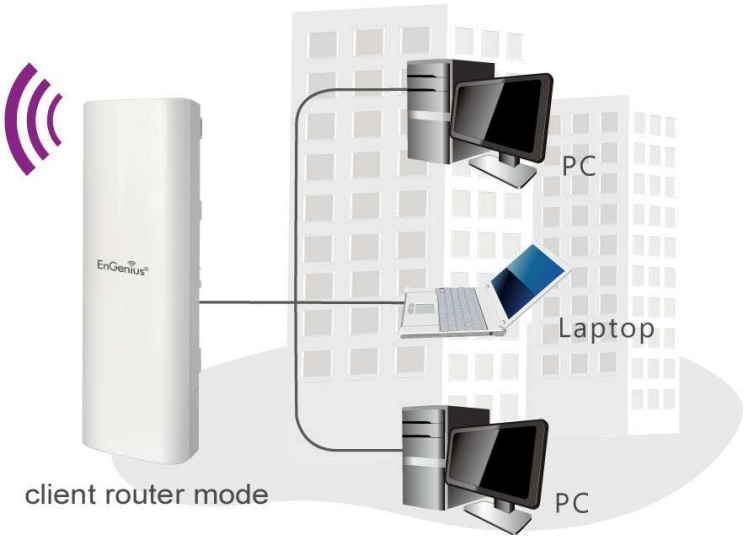


CAUTION **WDS Bridge Mode is unlike Access Point Mode. APs linked by WDS are using the same wireless channel, and connecting excessive numbers of APs on the same channel may result in lower throughput. Please be aware to avoid loop connections; otherwise enable the Spanning Tree Function.**

3.5 Client Router Mode

In Client Router Mode, the ENH202 provides two functions: 1) acting as a wireless-Ethernet Bridge in order to relay signal from the access point; 2) acting as an active DHCP server that allows WLAN clients to share the same wireless network connection. Ideally, have clients wirelessly connect to an AP/WISP and connect to LANs via Ethernet. Client Router Mode is different from the AP Router Mode. It is not a common application however useful when connects to WISP AP.

AP/WISP



client router mode

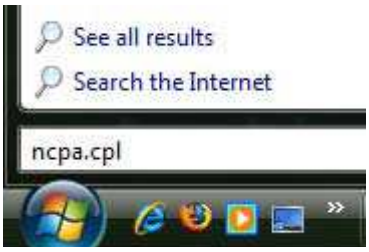
4 Configuring Your Computer for TCP/IP

This chapter describes how to configure the TCP/IP settings on a computer that will be used to configure the ENH202. Because the default operating mode is Client Bridge, an IP address will not be assigned to the computer/notebook. Therefore, follow the steps below to assign an IP address to a client's Ethernet adapter.

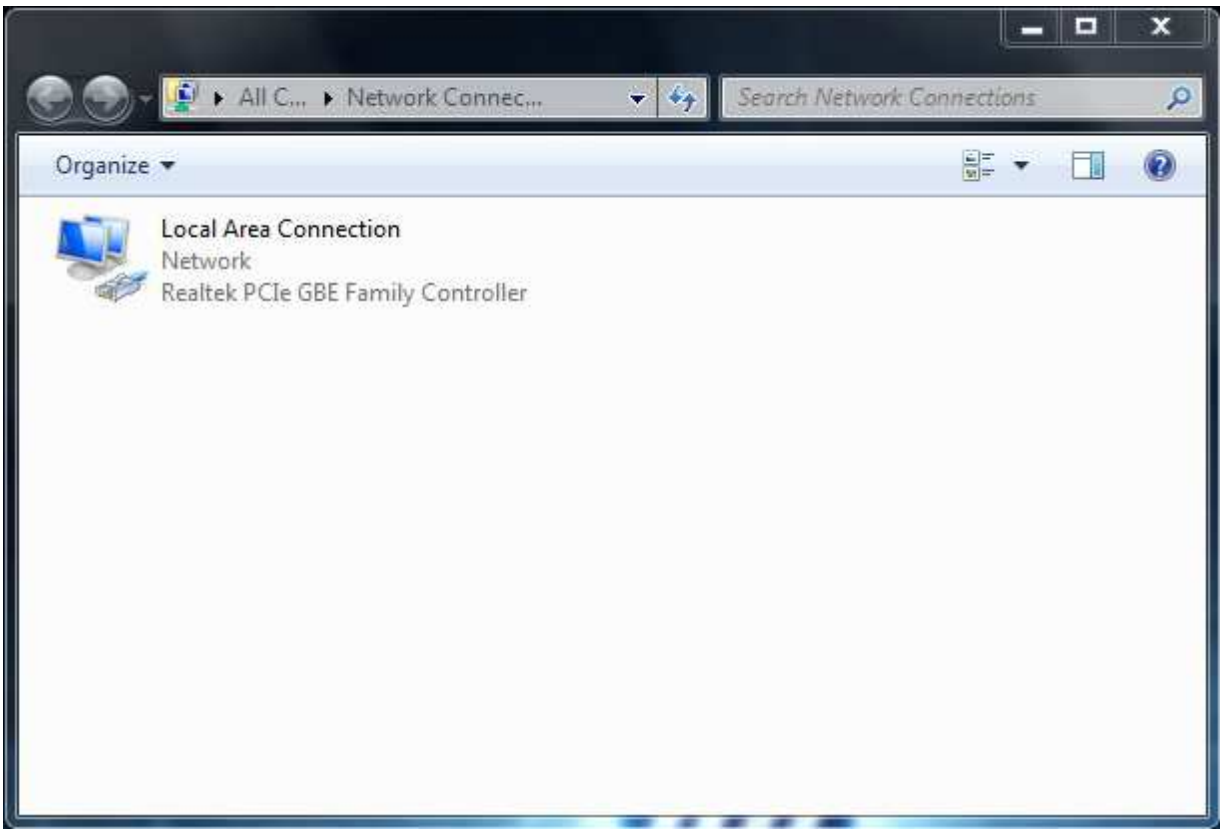
4.1 Configuring Microsoft Windows 7

Use the following procedure to configure a computer running Microsoft Windows 7.

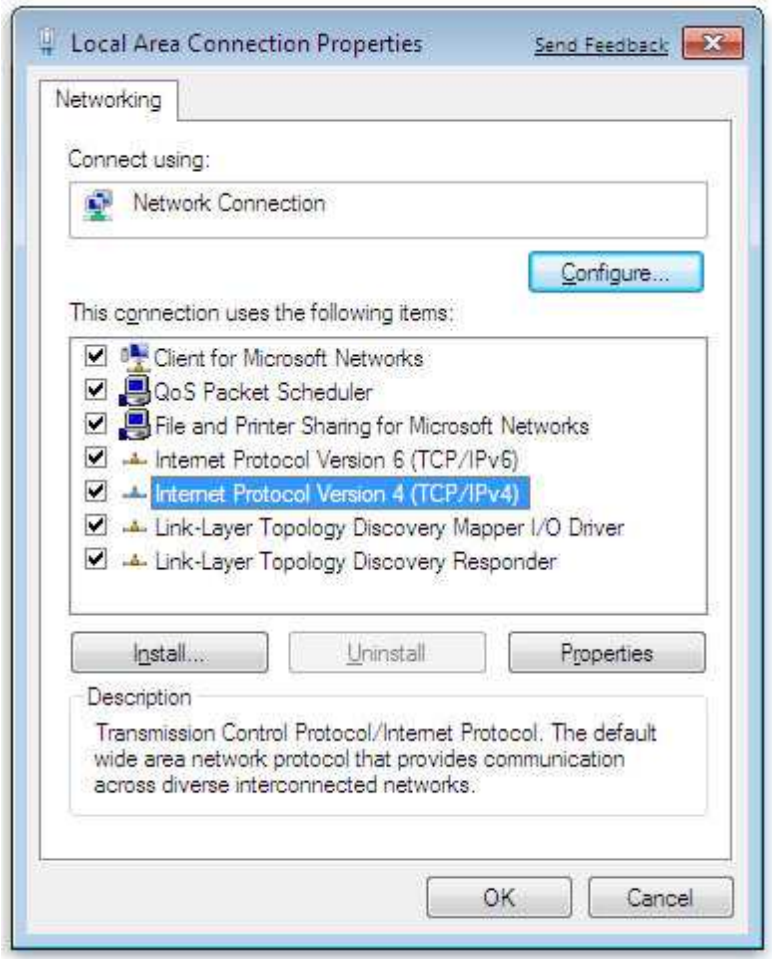
1. In the Start menu search box, type: **ncpa.cpl**



2. When the Network Connections List appears, right-click the **Local Area Connection** icon and click **Properties**.



3. In the Networking tab, click **Internet Protocol Version 4 (TCP/IPv4)**, and then click **Properties**.

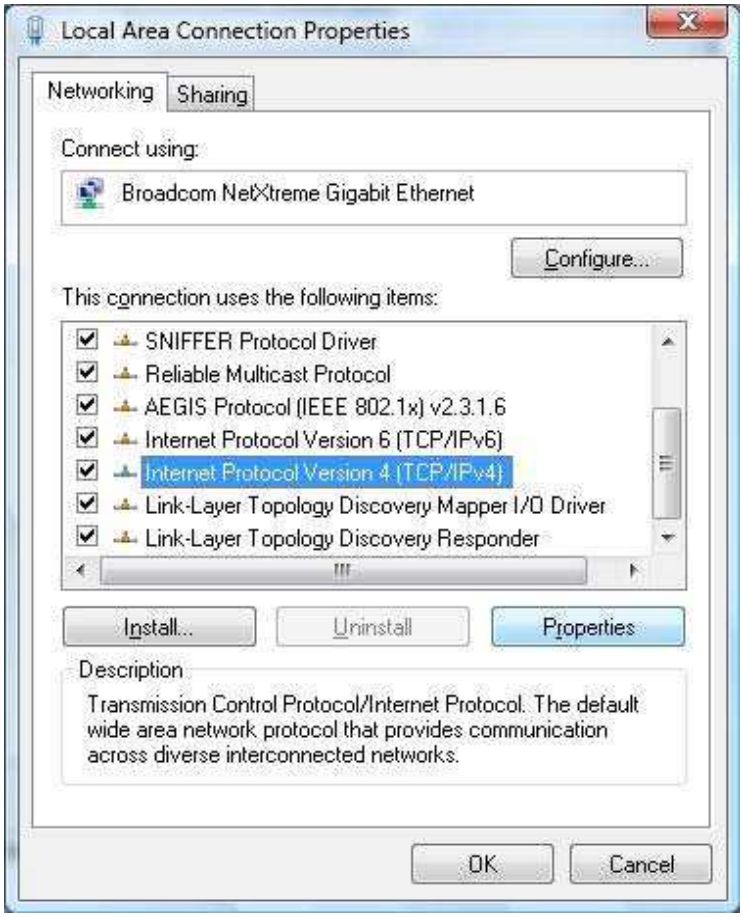


4. In the properties dialog box, click **Use the following IP address:** to configure your computer for Static TCP/IP. Enter an **IP address** (i.e. 192.168.1.10), the **subnet mask** of the ENH202, and the **default gateway** which is the ENH202's IP address, 192.168.1.1. Note: the subnet mask must match that of the ENH202 and the IP address must be on that subnet.
5. Click the **OK** button to save your changes and close the dialog box.
6. Click the **OK** button again to save your changes.

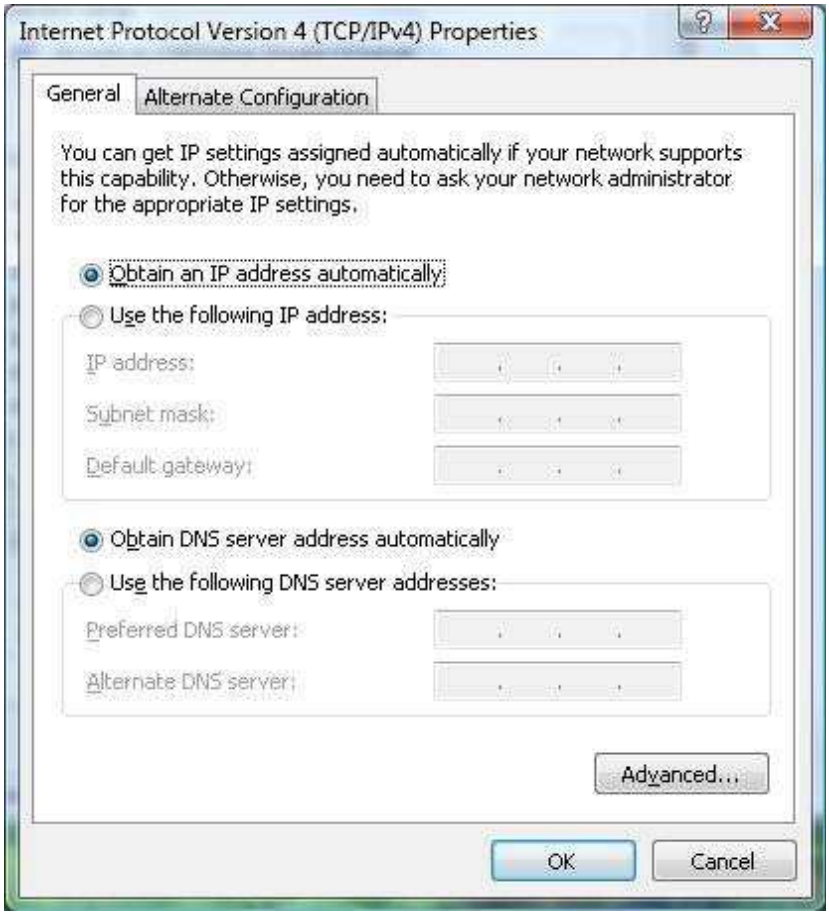
4.2 Configuring Microsoft Windows Vista

Use the following procedure to configure a computer running Microsoft Windows Vista with the default Windows interface.

1. On the Windows taskbar, click **Start**, click **Control Panel**, and then select the **Network and Internet** icon.
2. Click **View Network Status and tasks** and then click **Manage Networks Connections**.
3. Right-click the **Local Area Connection** icon and click **Properties**.
4. Click **Continue**. The Local Area Connection Properties dialog box appears.
5. In the Local Area Connection Properties dialog box, verify that **Internet Protocol (TCP/IPv4)** is checked. Then select **Internet Protocol (TCP/IPv4)** and click the **Properties** button. The Internet Protocol Version 4 Properties dialog box appears.



6. In the properties dialog box, click **Use the following IP address:** to configure your computer for Static TCP/IP. Enter an **IP address** (i.e. 192.168.1.10), the **subnet mask** of the ENH202, and the **default gateway** which is the ENH202's IP address, 192.168.1.1. Note: the subnet mask must match that of the ENH202 and the IP address must be on that subnet.

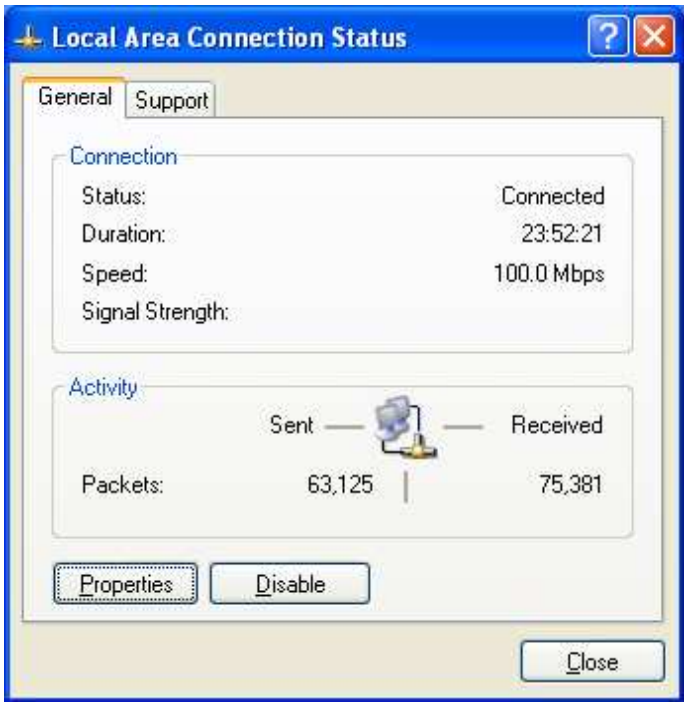


7. Click the **OK** button to save your changes and close the dialog box.
8. Click the **OK** button again to save your changes.

4.3 Configuring Microsoft Windows XP

Use the following procedure to configure a computer running Microsoft Windows XP with the default Windows interface.

1. On the Windows taskbar, click **Start**, click **Control Panel**, and then click **Network and Internet Connections**.
2. Click the **Network Connections** icon.
3. Click **Local Area Connection** for the Ethernet adapter connected to the ENH202. The Local Area Connection Status dialog box appears.
4. In the Local Area Connection Status dialog box, click the **Properties** button. The Local Area Connection Properties dialog box appears.

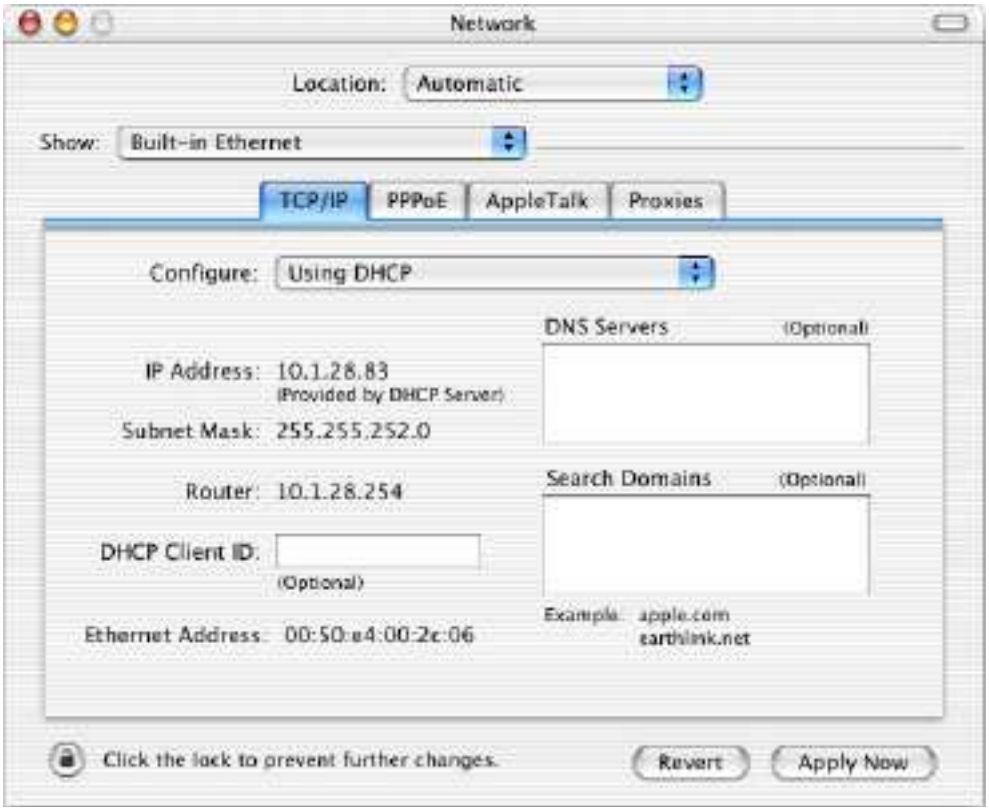


5. In the Local Area Connection Properties dialog box, verify that **Internet Protocol (TCP/IP)** is checked. Then select **Internet Protocol (TCP/IP)** and click the **Properties** button. The Internet Protocol (TCP/IP) Properties dialog box appears.
6. In the properties dialog box, click **Use the following IP address:** to configure your computer for Static TCP/IP. Enter an **IP address** (i.e. 192.168.1.10), the **subnet mask** of the ENH202, and the **default gateway** which is the ENH202's IP address, 192.168.1.1. Note: the subnet mask must match that of the ENH202 and the IP address must be on that subnet.
7. Click the **OK** button to save your changes and close the dialog box.
8. Click the **OK** button again to save your changes.

4.4 Configuring Apple Mac OS X

The following procedure describes how to configure TCP/IP on an Apple Macintosh running Mac OS 10.2 or later. Note: The menu titles and placement vary in each OS X 10.x operating system but are typically similar.

1. Pull down the Apple Menu, click **System Preferences**, and select **Network**.
2. Verify that the NIC connected to the ENH202 is selected in the **Show** field.
3. In the **Configure** field on the **TCP/IP** tab, select **Manually**.
4. Click **Apply Now** to apply your settings and close the TCP/IP dialog box.
5. Enter an **IP address** (i.e. 192.168.1.10), the **subnet mask** of the ENH202, and the **Router** which is the ENH202's IP address, 192.168.1.1. Note: the subnet mask must match that of the ENH202 and the IP address must be on that subnet.
6. Click **Apply Now** to apply your settings and close the TCP/IP dialog box.



4.5 Logging into the ENH202

After completing the TCP/IP settings from the beginning of the Chapter, you can now access the web-based configuration menu.

1. Open your web browser.

2. Enter IP **192.168.1.1** into your address bar.

CAUTION **If you have changed the ENH202 LAN IP address, make sure you enter the correct IP Address.**

3. After successfully connecting to the ENH202, a browser pop-up with a Windows Security notice will appear. Please enter the correct **Username** and **Password**.

4. The default Username and Password are both **admin**.

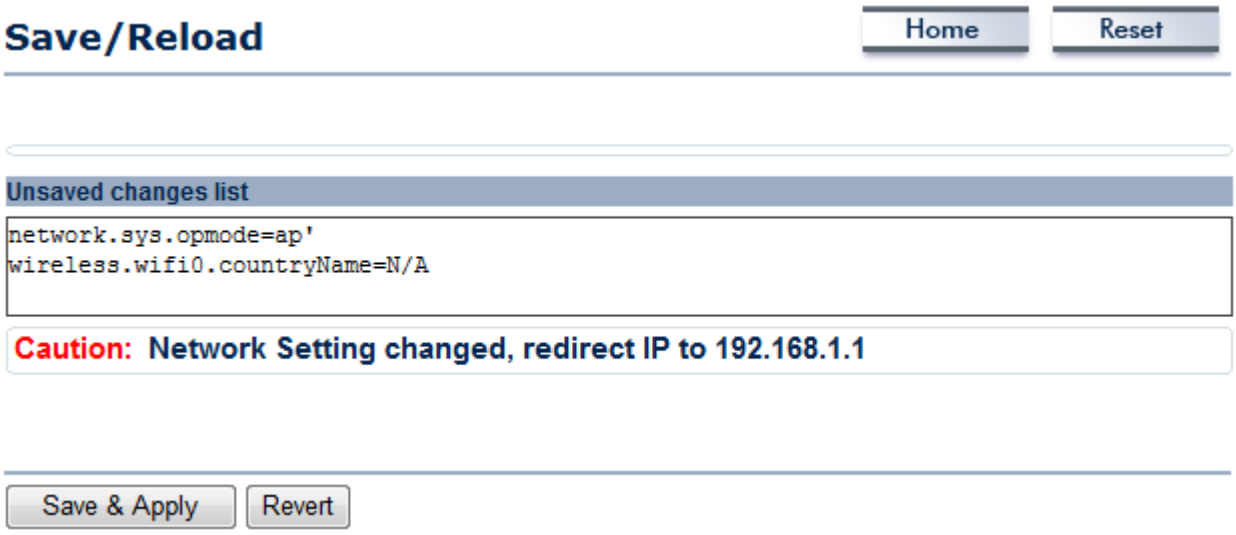
NOTE If you have changed the Username and Password, please enter the correct *Username* and *Password*.

5 Status

The **Status** section is on the navigation drop-down menu. Selecting it, you will then see three options: Main, Wireless Client List, and System Log. Each option is described in detail below.

5.1 Save / Load

This page allows viewing of the modified settings. The changes will show in the *Unsaved changes list*. You can decide to cancel **(Revert)** all the changes or to **Save & Apply** the new settings.



NOTE Please make note of the following:

1. You cannot cancel specific settings. You can only save all of the settings or revert to the previously saved state.
2. You need to use the Save/Reload page to commit your configurations by clicking the “Save & Apply” button.

5.2 Main

Click on the **Main** link under the **Status** drop-down menu or click **Home** from the top-right of the webpage. The status that is displayed corresponds with the operating mode that is selected. Information such as operating mode, system up-time, firmware version, serial number, kernel version, and application version are displayed in the *System* section. LAN IP address, subnet mask, and MAC address are displayed in the *LAN* section. In the *Wireless section*, the frequency and channel are displayed. Since this device supports multiple-SSIDs, the details of each SSID, such as ESSID and its security settings are displayed.

Main Home Reset

System Information

Device Name	ENH202
Ethernet Main MAC Address	00:02:6F:BB:F1:A6
Ethernet Secondary MAC Address	00:02:6F:BB:F1:A6
Wireless MAC Address	00:02:6F:BB:F1:A6
Country	N/A
Current Time	Thu Jul 28 10:17:22 UTC 2011
Firmware Version	1.0.4
Management VLAN ID	Untagged

LAN Settings

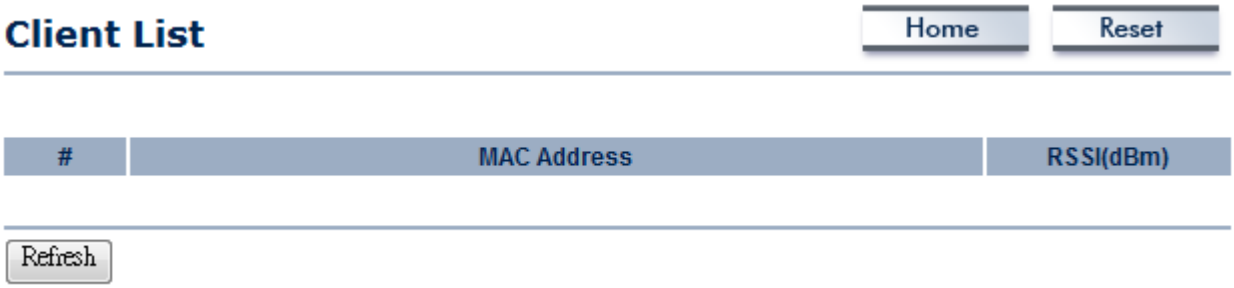
IP Address	192.168.1.1
Subnet Mask	255.255.255.0
Default Gateway	192.168.1.1
Primary DNS	0.0.0.0
Secondary DNS	
DHCP Client	Disabled

Current Wireless Settings

Operation Mode	Access Point	
Wireless Mode	IEEE 802.11b/g/n Mixed	
Channel Bandwidth	40 MHz	
Frequency/Channel	2.437 GHz (Channel 6)	
Profile Isolation	No	
Profile Settings (SSID/Security/VID)	1	EnGenius1/None/1
	2	N/A
	3	N/A
	4	N/A
Spanning Tree Protocol	Disabled	
Distance	1 Km	

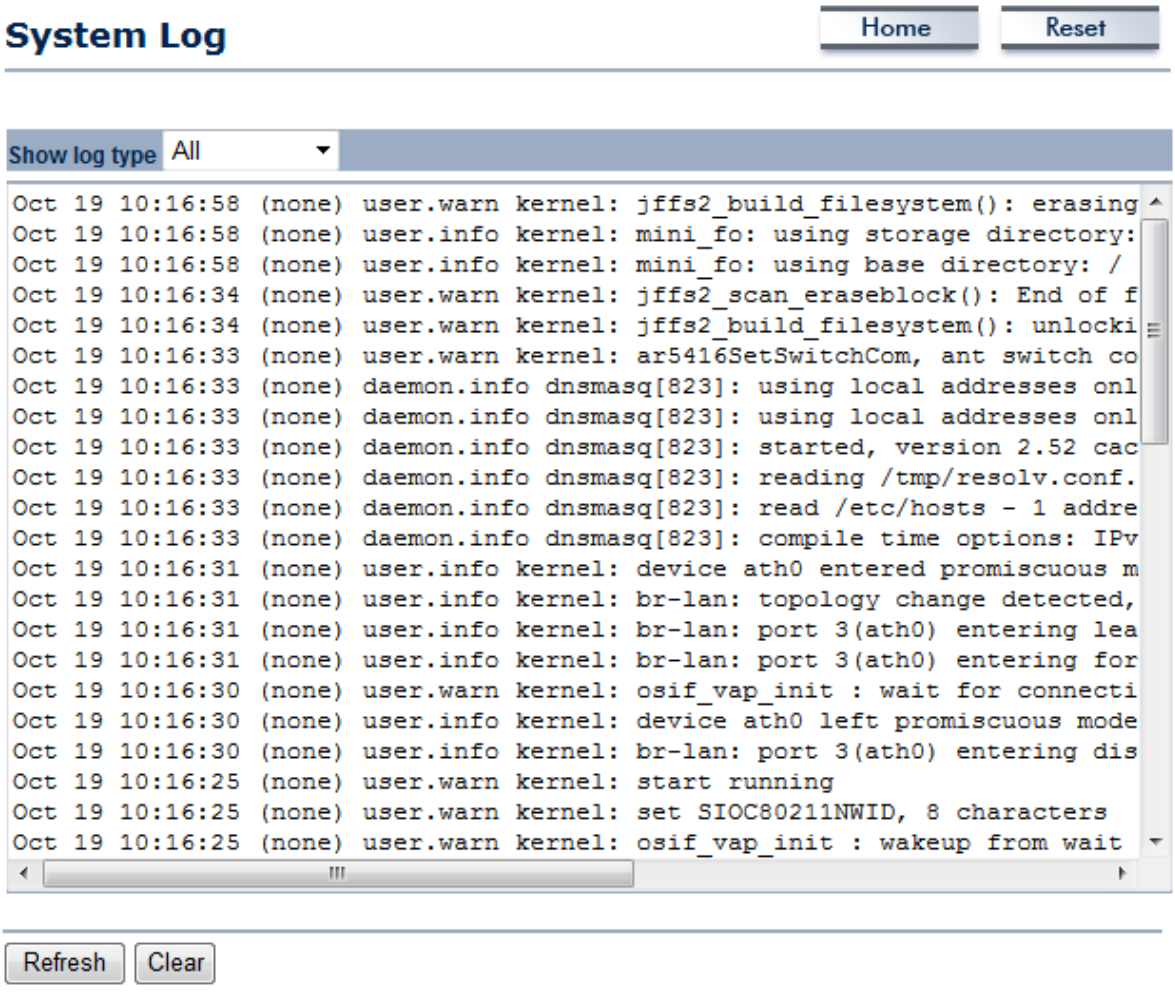
5.3 Wireless Client List

Click on the **Wireless Client List** link under the **Status** drop-down menu. This page displays the list of Clients that are associated to the ENH202. The MAC addresses and signal strength for each client is displayed. Click on the **Refresh** button to refresh the client list.



5.4 System Log

Click on the **System Log** link under the **Status** drop-down menu. The device automatically records events in its internal memory. When there is not enough internal memory for all of the most recent events, events are deleted in descending chronological order so that the latest events may be retained.



5.5 Connection Status

Click on the **Connection Status** link under the **Status** drop-down menu. This page displays the current status of the network, including Network Type, SSID, BSSID, Connection Status, Wireless Mode, Current Channel, Security, Data Rate, Current noise level, and Signal strength.

Wireless

Network Type	Client Router
SSID	EnGenius
BSSID	N/A
Connection Status	N/A
Wireless Mode	N/A
Current Channel	N/A
Security	N/A
Tx Data Rate(Mbps)	N/A
Current noise level	N/A
Signal strength	N/A

WAN

MAC Address	00:02:6f:75:9f:a8
Connection Type	Static IP
Connection Status	Down
IP Address	
IP Subnet Mask	0.0.0.0

Refresh

5.6 DHCP Client Table

Click on the **DHCP Client List** link under the **Status** drop-down menu. This page displays the list of Clients that are associated to the ENH202 through DHCP. The MAC addresses and signal strength for each client is displayed. Click on the **Refresh** button to refresh the client list.

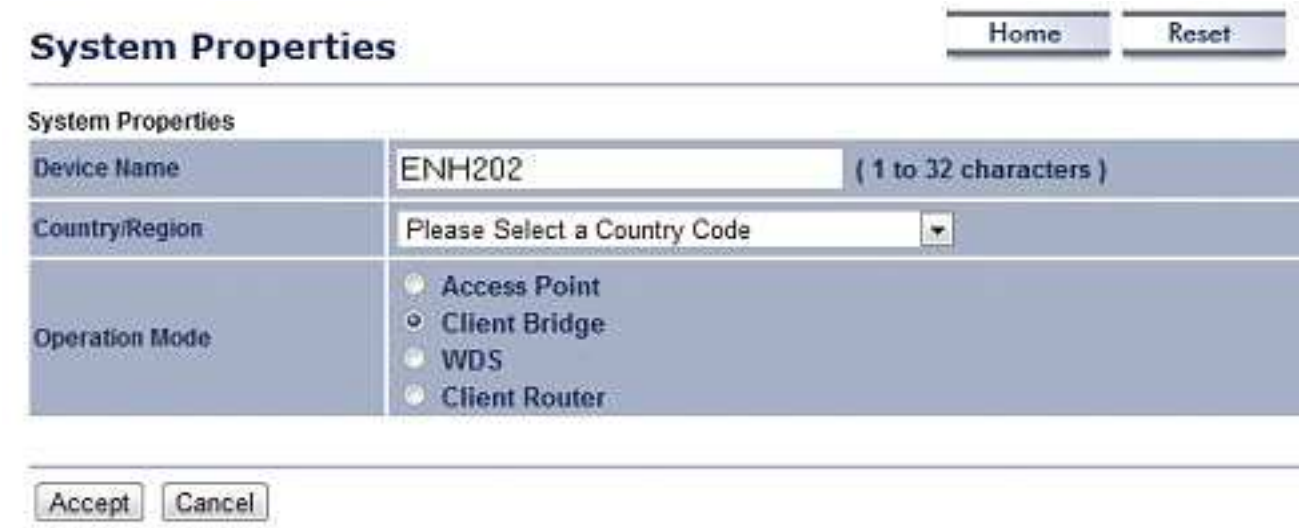
6 System

6.1 Switching the Operation Mode

The ENH202 supports 4 modes: Access Point, Client Bridge, WDS Bridge, and Client Router. In order to switch between the operating modes, please go to System -> Operation mode.

To begin, click **System Properties** under System Section.



- **Device Name**: Specify a name for the device. It is not the broadcast SSID; this will be shown in SNMP management.
- **Country/Region**: Select a Country/Region to conform to local regulations.
- **Operation Mode**: Select an operation mode via a **Radio Button**.

Click **Accept** to confirm the changes.

Accept does not apply the changes – you must go to Status -> Save / Load to apply the new settings. Please refer to Chapter 4.1 for more information.

If you would like to use Access Point with WDS Function mode, please select Access Point Mode and then enable WDS function in the Wireless Network section. The scenario requiring this functionality, WDS and AP, is rare.

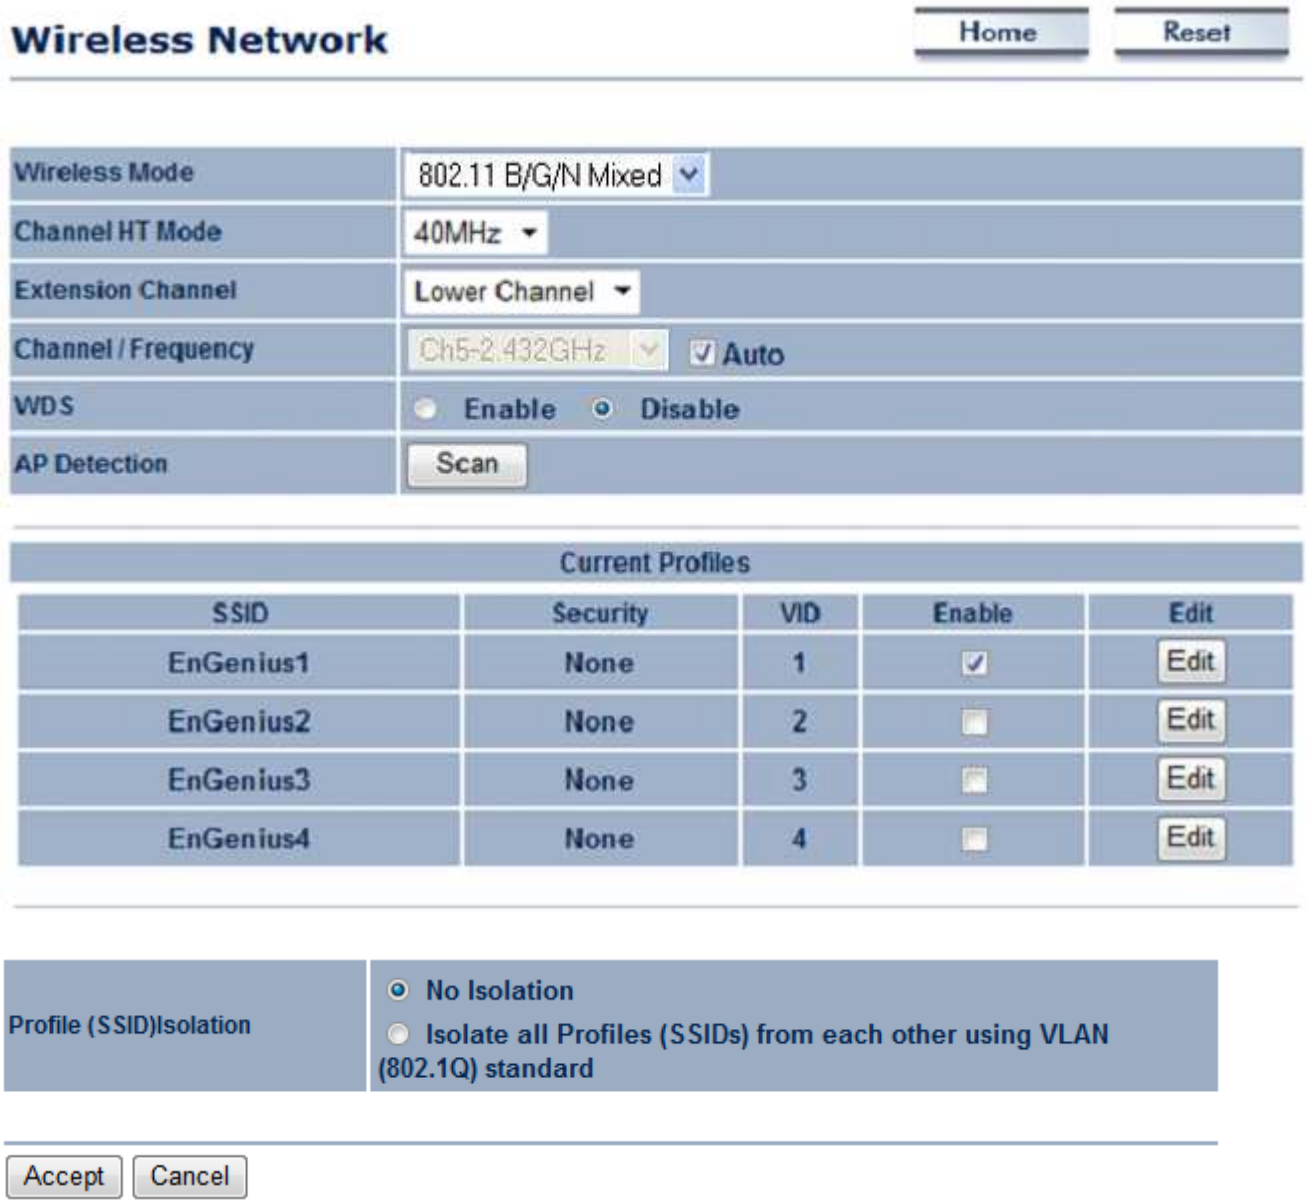
7 Wireless Configuration

This section will guide you through all of the wireless settings. Please read the instructions carefully. Inappropriate settings could lower the performance or affect the stability of your network. Before continuing, please make sure you have chosen the correct operating mode.

7.1 Wireless Settings

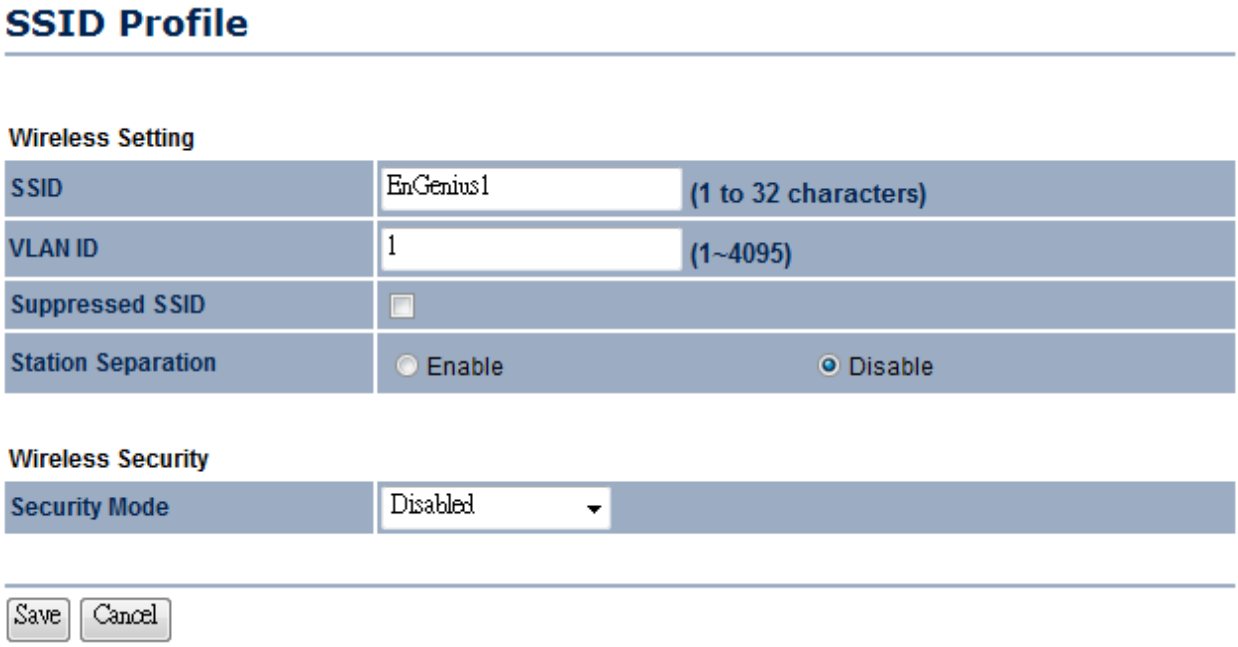
This section contains the basic wireless settings. Please read the description carefully and consult Chapter 10 for more detailed information.

7.1.1 Access Point Mode



Wireless Mode	The wireless mode supports 802.11b/g/n mixed operation. It is compatible with the most common wireless bands.
Channel HT Mode	The default channel bandwidth is 40 MHz. A larger channel can provide better transmit quality and speed.
Extension Channel	Specify the upper channel or lower channel selection. It may influence the Auto channel function.
Channel / Frequency	The channel availability is determined by the country's regulations. The device operates in the 2.4GHz spectrum.
Auto	Place a **check** mark to enable Auto channel selection.
AP Detection	AP Detection can help to select a best channel by scanning the nearby area.
Current Profile	Configure up to four different SSIDs; it allows for the division of clients into separate groups to access the network. Press **Edit** to configure the profile and place a **check** to enable an additional SSID.
Profile Isolation	Restrict client communications with different VID by selecting the Radio button.
Accept / Cancel	Press **Accept** to confirm the changes or **Cancel** to return to the previous settings.

Accept does not apply the changes – you must go to Status -> Save / Load to apply the new settings. Please refer to Chapter 4.1 for more information.

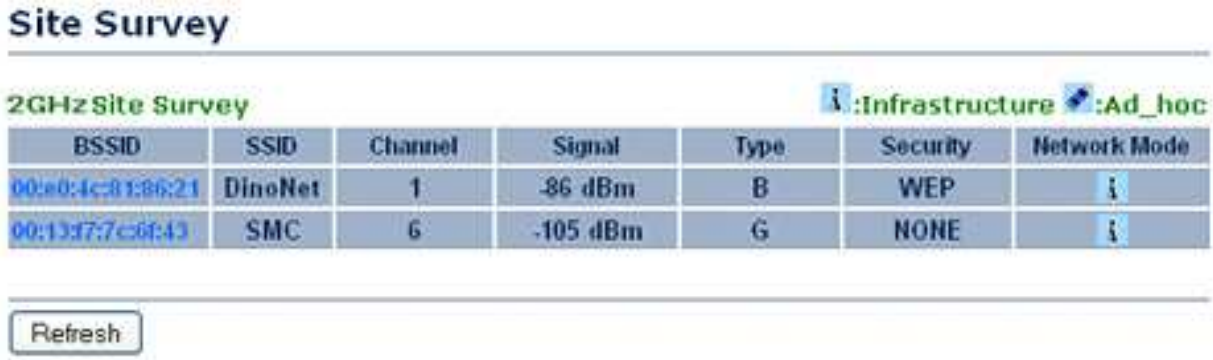


SSID	Specify the SSID for current profile.
VLAN ID	Specify the VLAN tag for current profile.
Suppressed SSID	Place a c**heck** to hide the SSID. Clients will not be able to see the broadcast SSID in Site Survey.
Station Separation	Select the Radio button to allow / deny clients to communicate with one another.
Wireless Security	Please refer to the Wireless Security section.
Save / Cancel	Press **Save** to save the changes or **Cancel** to return previous settings.

7.1.2 Client Bridge Mode

Wireless Mode	The wireless mode supports 802.11b/g/n mixed operation. It is compatible with the most common known wireless bands.
SSID	Specify the SSID if known. The SSID text box will be automatically filled in when an AP in the Site Survey is selected.
Site Survey	Use Site Survey to scan nearby APs, and then select the AP to establish a connection.
Prefer BSSID	Specify the MAC address, if known. The Prefer BSSID check box will be automatically filled in when an AP in the Site Survey is selected.
WDS Client	Select a Radio button to Enable / Disable WDS Client.
Wireless Security	Please refer to Chapter 6.2 for details.
Accept / Cancel	Press **Accept** to confirm the changes or **Cancel** to return previous settings.

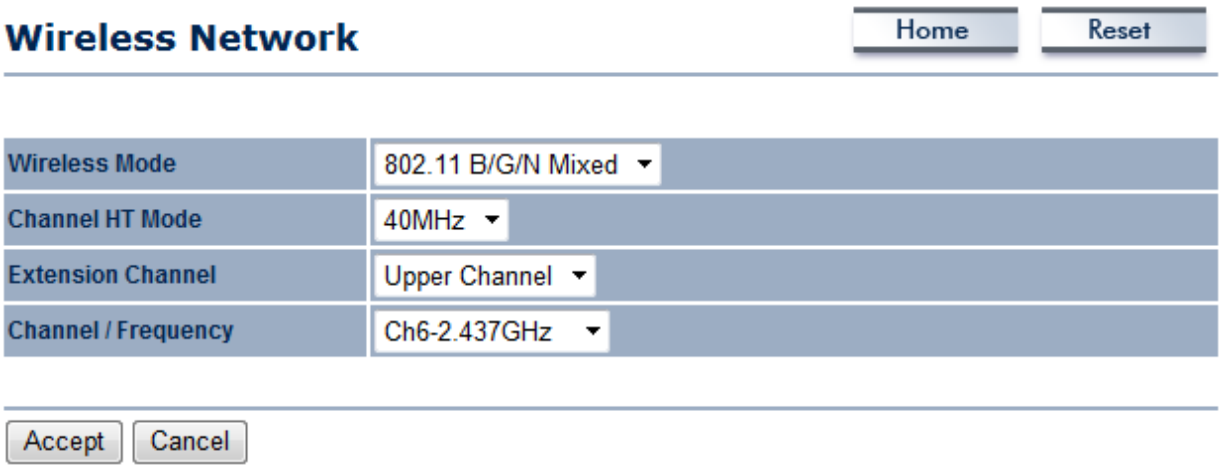
Accept does not apply the changes – you must go to Status -> Save / Load to apply the new settings. Please refer to Chapter 4.1 for more information.



Profile	After Site Survey, the webpage will display all of the nearby Access Points. Click the BSSID if you would like to connect with it.
Wireless Security	Please refer to the Wireless Security section.
Refresh	Press Refresh to scan again.

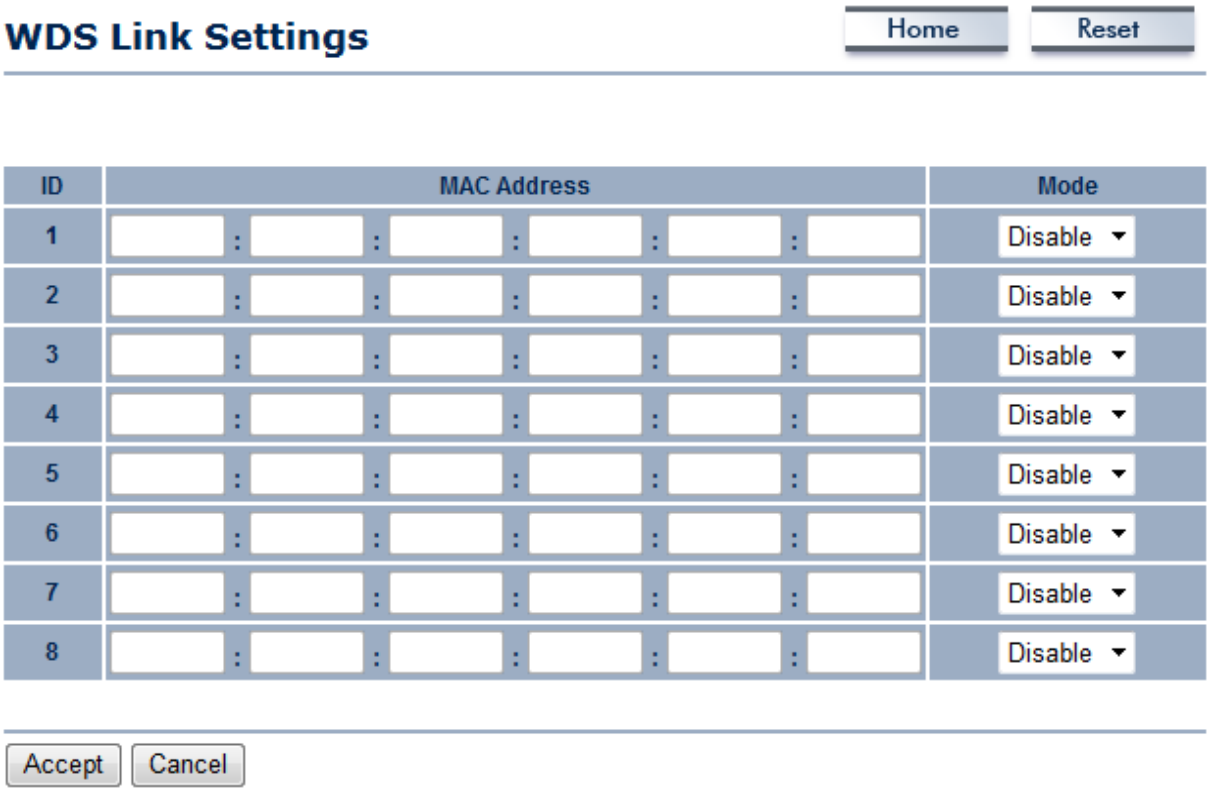
NOTE If the Access Point is suppressing its own SSID, the SSID section will be blank; the SSID must be entered manually.

7.1.3 WDS Bridge Mode



Wireless Mode	The wireless mode supports 802.11b/g/n mixed modes. It is compatible with the most common wireless bands.
Channel HT Mode	The default channel bandwidth is 40 MHz. A larger channel can provide better transmit quality and speed.
Extension Channel	Specify the upper channel or lower channel selection. It may influence the Auto channel function
Channel / Frequency	The channel availability is determined by the country's regulations.
Accept / Cancel	Press **Accept** to confirm the changes or **Cancel** to return to the previous settings.

Accept does not apply the changes – you must go to Status -> Save / Load to apply the new settings. Please refer to Chapter 4.1 for more information.



MAC Address	Enter the Access Point's MAC address that you would like to extend the wireless coverage of into the MAC address filter.
Mode	Select **Disable** or **Enable** from the drop down list.
Accept / Cancel	Press **Accept** to confirm the changes or **Cancel** to return to the previous settings.

Please make note of the following:

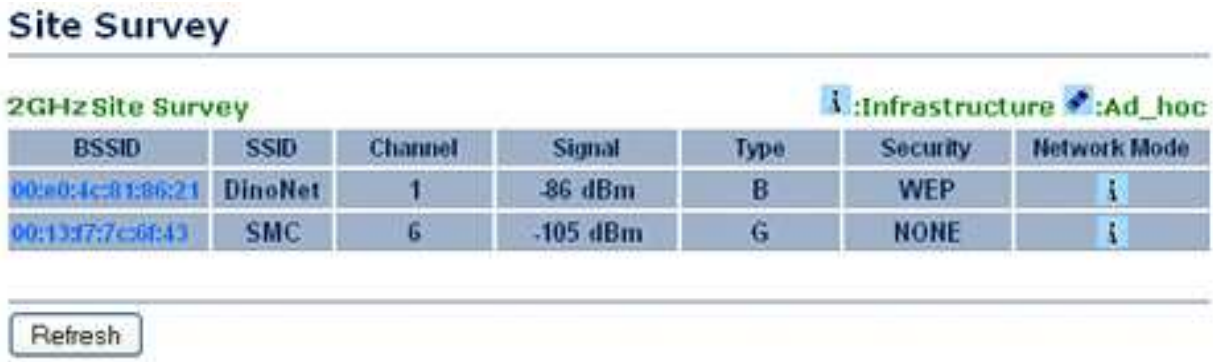
1. Accept does not apply the changes – you must go to Status -> Save / Load to apply the new settings. Please refer to Chapter 4.1 for more information.

2. You must enter the MAC address of the Access Point whose wireless coverage you would like to extend. Not all Access Point supports this feature.

7.1.4 Client Router Mode

Wireless Mode	The wireless mode supports 802.11b/g/n mixed operation. It is compatible with the most common wireless bands.
SSID	Specify the SSID, if known. The SSID text box will be automatically filled in if an AP in the Site Survey is selected.
Site Survey	Use Site Survey to scan nearby APs, and then select the AP to establish a connection.
Prefer BSSID	Specify the MAC address, if known. Prefer BSSID text box will be automatically filled in when an AP in the Site Survey is selected.
Wireless Security	Please refer to Chapter 6.2 for details.
Accept / Cancel	Press **Accept** to confirm the changes or **Cancel** to return to the previous settings.

Accept does not apply the changes – you must go to Status -> Save / Load to apply the new settings. Please refer to Chapter 4.1 for more information.



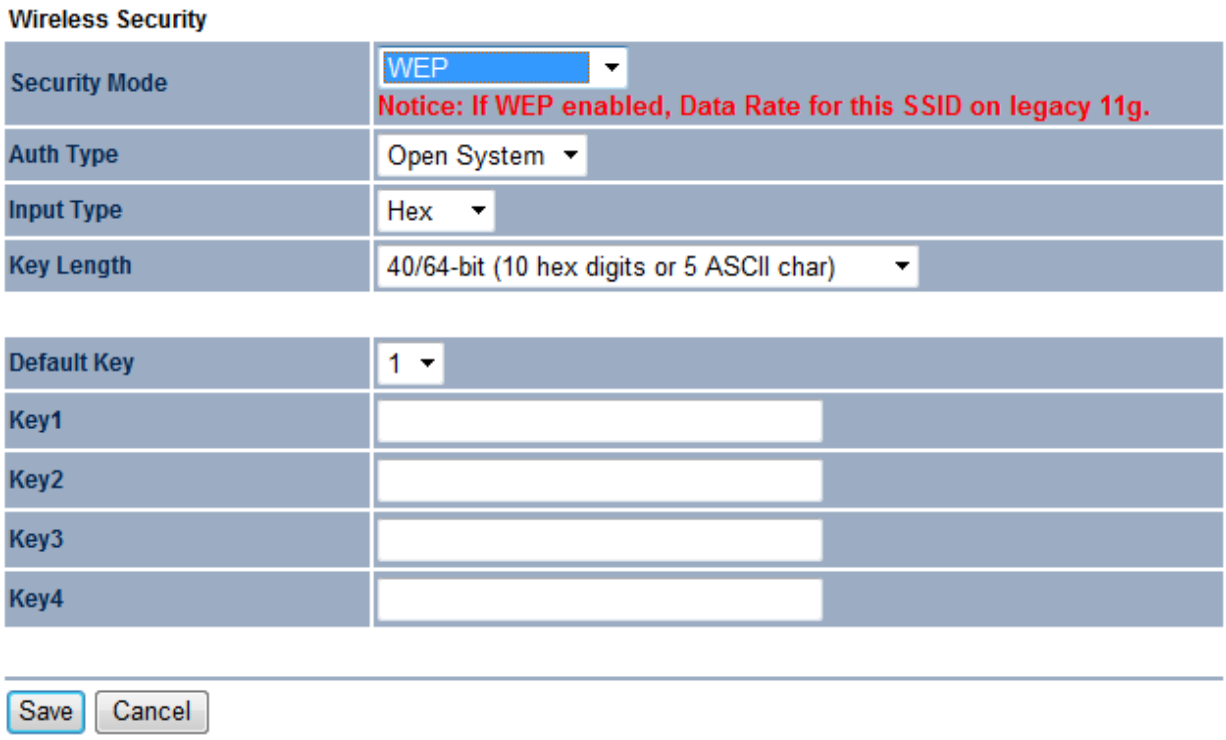
Profile	After Site Survey, the webpage will display all nearby Access Points. Click the BSSID if you would like to connect with an AP.
Wireless Security	Please refer to the Wireless Security section.
Refresh	Press **Refresh** to scan again.

NOTE If the Access Point is suppressing its own SSID, the SSID section will be blank; the SSID must be entered manually.

7.2 Wireless Security Settings

Wireless Security Settings section will guide you through the Security configurations: WEP, WPA-PSK, WPA2-PSK, WPA-PSK Mixed, WPA, WPA2, and WPA Mixed. We strongly recommend the use of WPA2-PSK as your security setting.

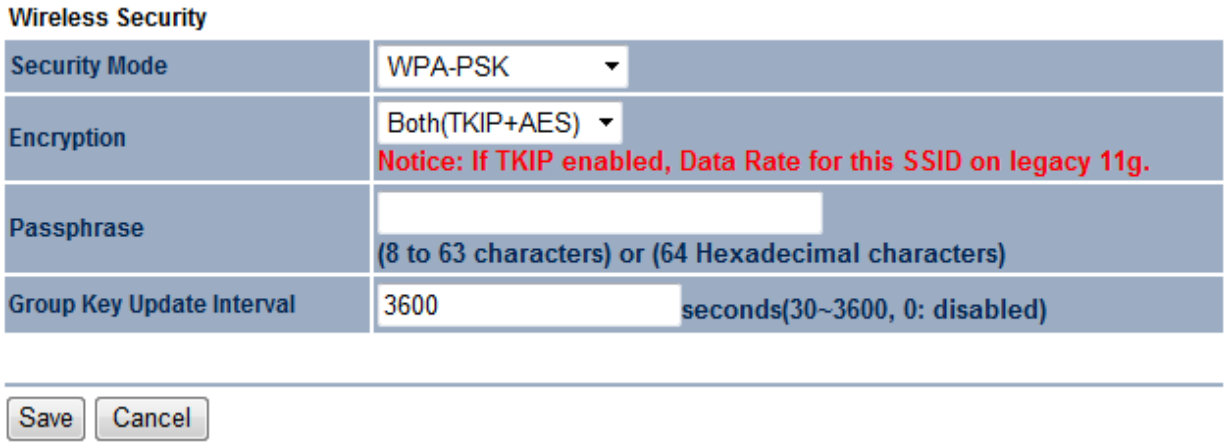
7.2.1 WEP



Security Mode	Select **WEP** from the drop down list.
Auth Type	Select Auth Type in **Open System** or **Shared**.
Input Type	Select Input Type in **Hex** or **ASCII**.
Key Length	Select Key Length in **64/128/152 bit** password length.
Default Key	Select the default index key for wireless security.
Key1	Specify password for security key index No.1.
Key2	Specify password for security key index No.2.
Key3	Specify password for security key index No.3.
Key4	Specify password for security key index No.4.

NOTE The IEEE 802.11n standard does not include WEP/WPA-PSK/WPA-PSK TKIP security mode. To comply with the standard, when you use the above encryptions, the wireless transmit mode will drop from 802.11n to 802.11g.

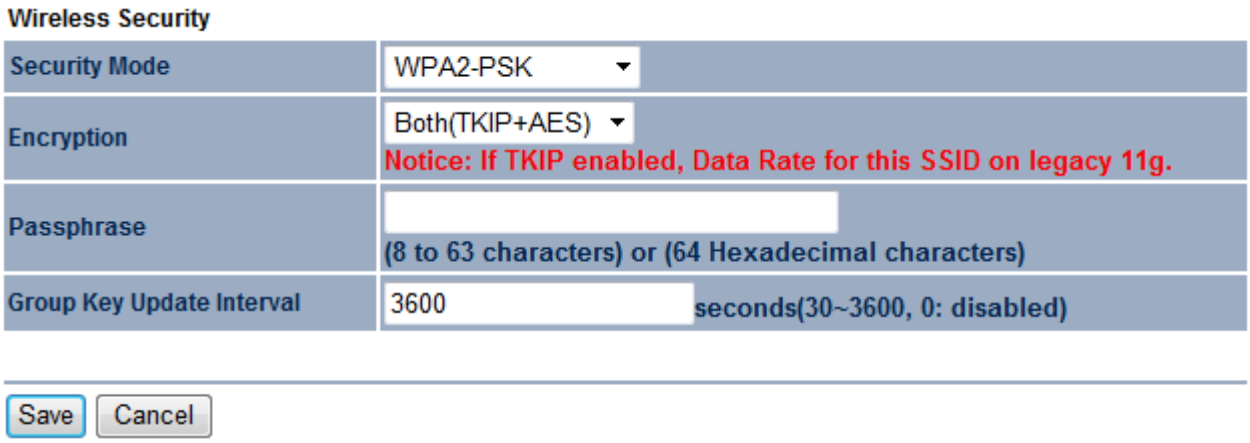
7.2.2 WPA-PSK



Security Mode	Select **WPA-PSK** from the drop down list.
Encryption	Select **Both**, **TKIP** or **AES** for encryption type.
Passphrase	Specify the security password.
Group Key Update Interval	Specify Group Key Update Interval time.

NOTE The IEEE 802.11n standard does not include WEP/WPA-PSK/WPA-PSK TKIP security mode. To comply with the standard, when you use the above encryptions, the wireless transmit mode will drop from 802.11n to 802.11g.

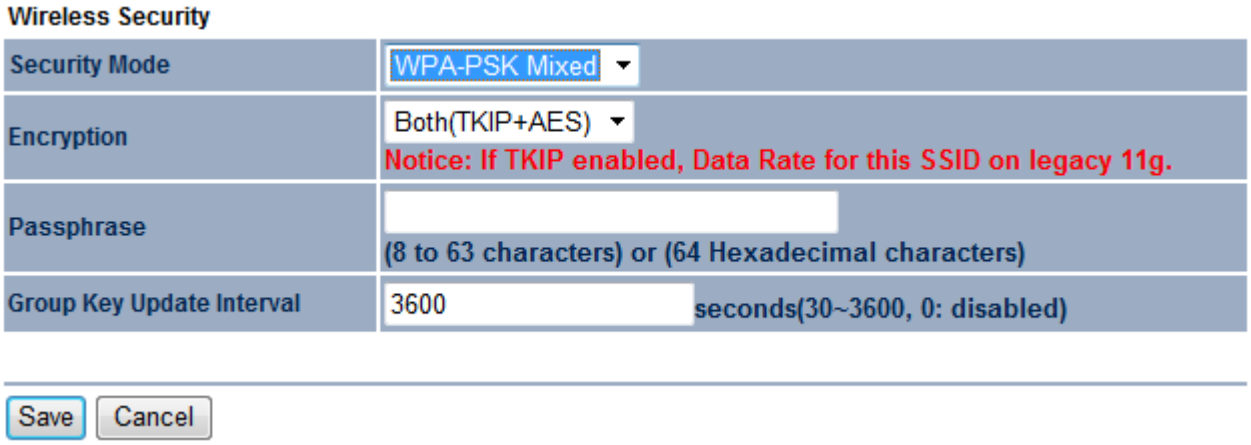
7.2.3 WPA2-PSK



Security Mode	Select **WPA2-PSK** from the drop down list.
Encryption	Select **Both**, **TKIP** or **AES** for encryption type.
Passphrase	Specify the security password.
Group Key Update Interval	Specify Group Key Update Interval time.

NOTE The IEEE 802.11n standard does not include WEP/WPA-PSK/WPA-PSK TKIP security mode. To comply with the standard, when you use the above encryptions, the wireless transmit mode will drop from 802.11n to 802.11g.

7.2.4 WPA-PSK Mixed

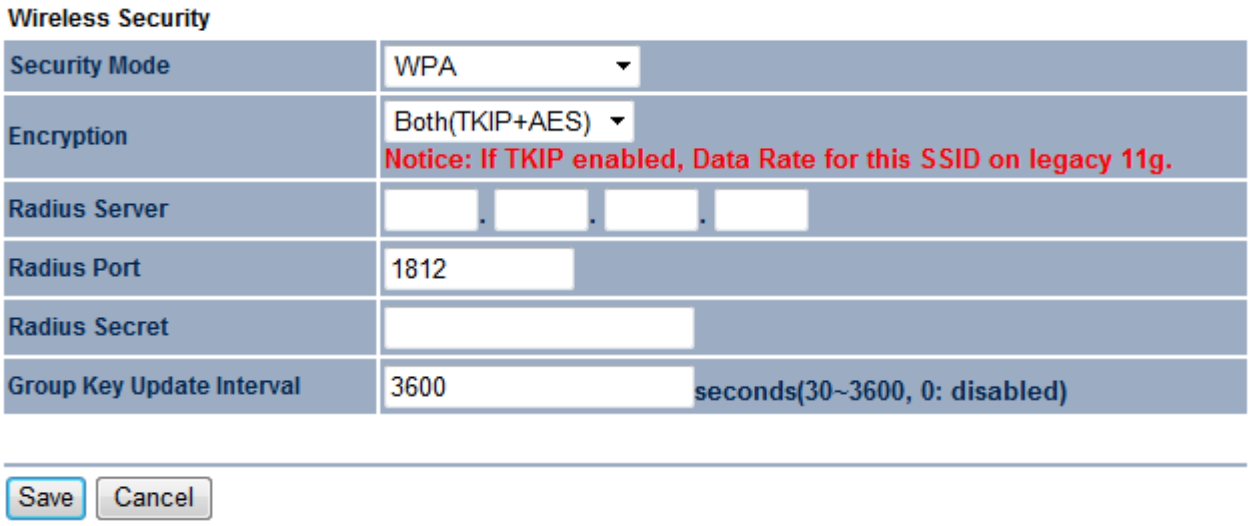


Security Mode	Select **WPA-PSK Mixed** from the drop down list.
Encryption	Select **Both**, **TKIP** or **AES** for encryption type.
Passphrase	Specify the security password.
Group Key Update Interval	Specify Group Key Update Interval time.

TIP Using WPA-PSK Mixed can allow multiple security modes at the same time.

NOTE The IEEE 802.11n standard does not include WEP/WPA-PSK/WPA-PSK TKIP security mode. To comply with the standard, when you use the above encryptions, the wireless transmit mode will drop from 802.11n to 802.11g.

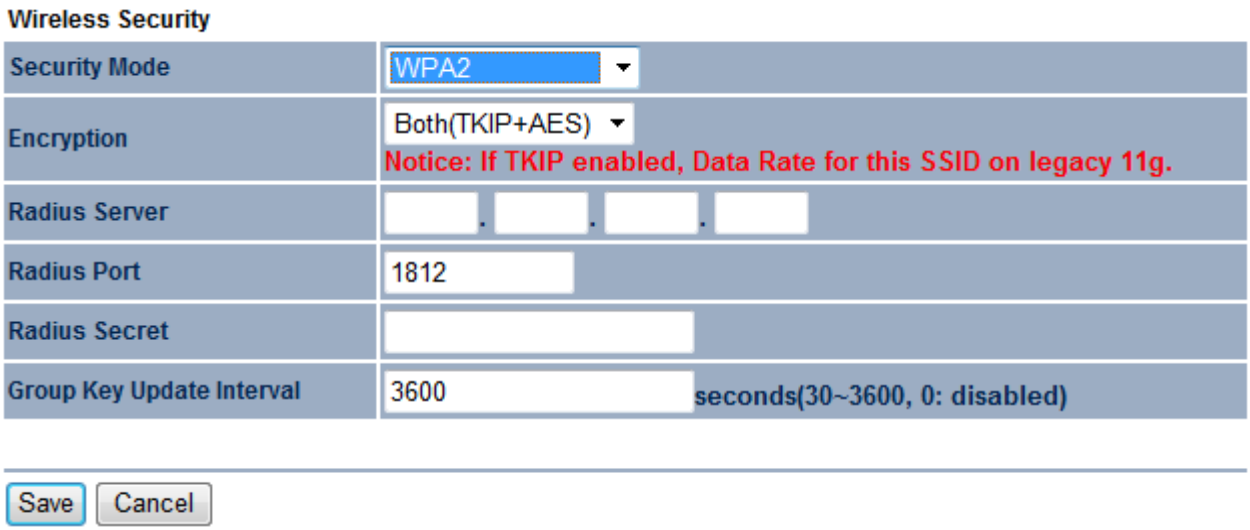
7.2.5 WPA



Security Mode	Select **WPA** from the drop down list.
Encryption	Select **Both**, **TKIP** or **AES** for Encryption type.
Radius Server	Specify Radius Server IP address.
Radius Port	Specify Radius Port number, the default port is 1812.
Radius Secret	Specify Radius Secret that is given by the Radius Server.
Group Key Update Interval	Specify Group Key Update Interval time.

The IEEE 802.11n standard does not include WEP/WPA-PSK/WPA-PSK TKIP security mode. To comply with the standard, when you use the above encryptions, the wireless transmit mode will drop from 802.11n to 802.11g.

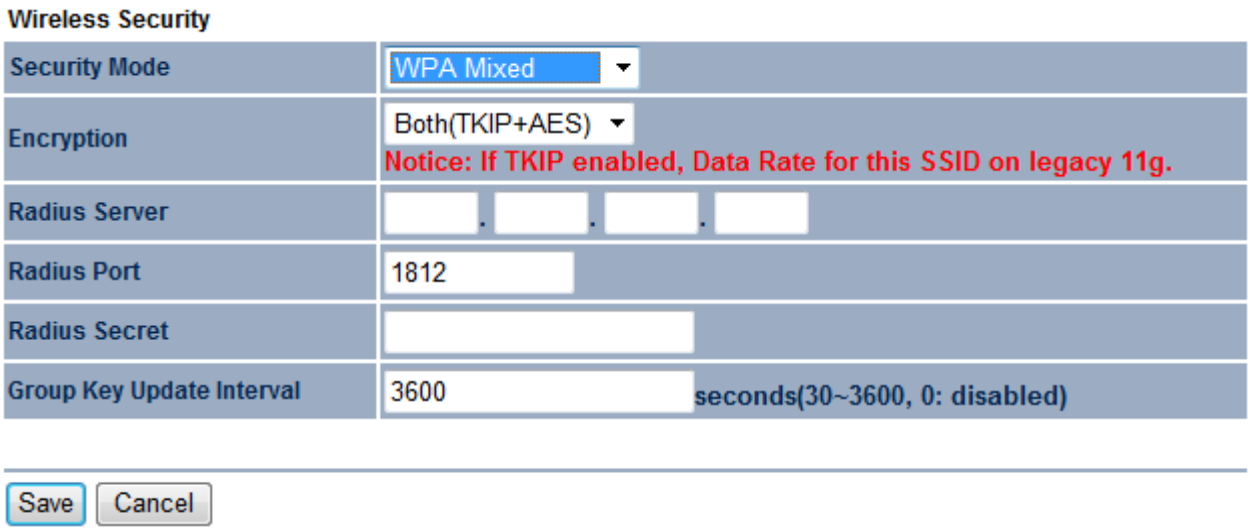
7.2.6 WPA2



Security Mode	Select **WPA2** from the drop down list.
Encryption	Select **Both**, **TKIP** or **AES** for encryption type.
Radius Server	Specify Radius Server IP Address.
Radius Port	Specify Radius Port number, the default port is 1812.
Radius Secret	Specify Radius Secret that is given by the Radius Server.
Group Key Update Interval	Specify Group Key Update Interval time.

The IEEE 802.11n standard does not include WEP/WPA-PSK/WPA-PSK TKIP security mode. To comply with the standard, when you use the above encryptions, the wireless transmit mode will drop from 802.11n to 802.11g.

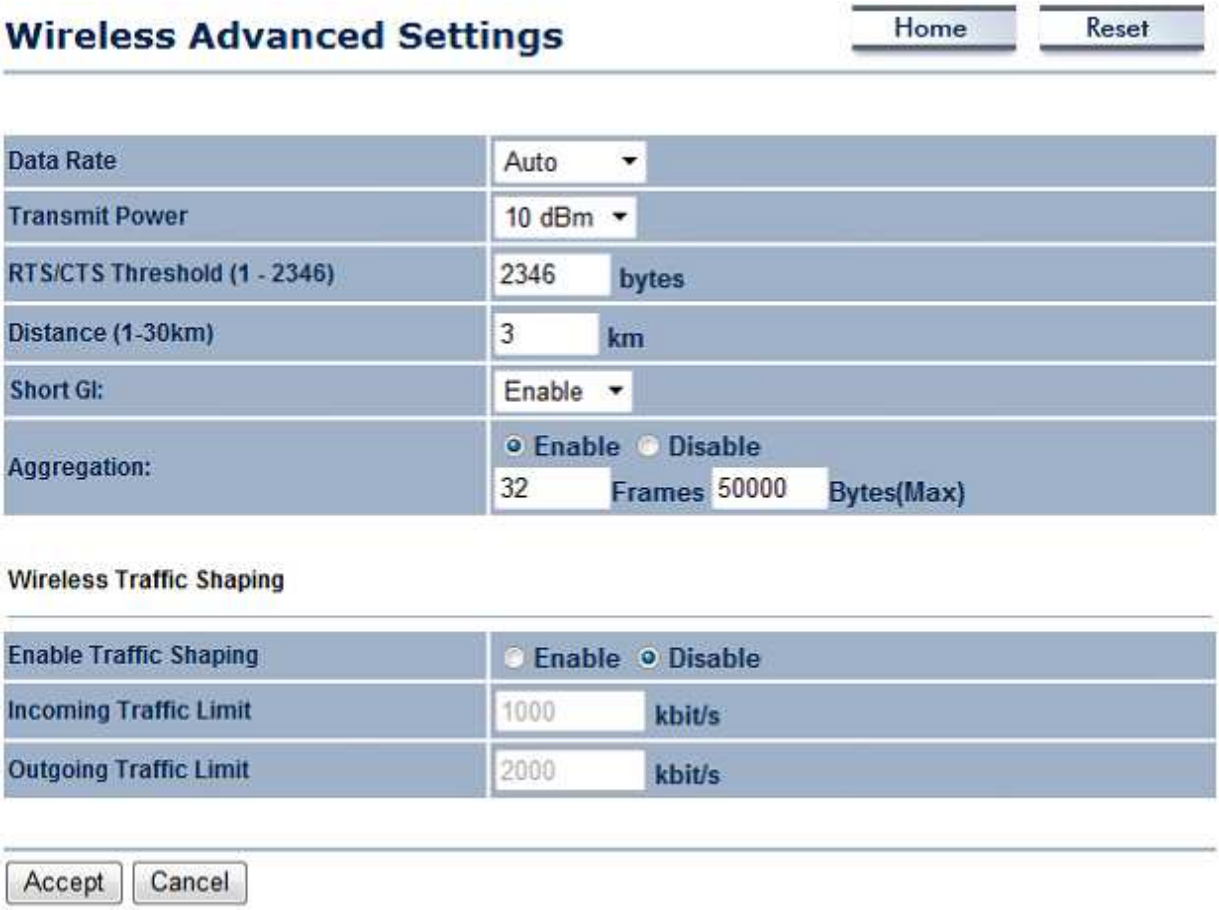
7.2.7 WPA Mixed



Security Mode	Select **WPA Mixed** from the drop down list.
Encryption	Select **Both**, **TKIP** or **AES** for encryption type.
Radius Server	Specify Radius Server IP Address.
Radius Port	Specify Radius Port number, the default port is 1812.
Radius Secret	Specify Radius Secret that is given by the Radius Server.
Group Key Update Interval	Specify Group Key Update Interval time.

NOTE The IEEE 802.11n standard does not include WEP/WPA-PSK/WPA-PSK TKIP security mode. To comply with the standard, when you use the above encryptions, the wireless transmit mode will drop from 802.11n to 802.11g.

7.3 Wireless Advanced Settings



Data Rate	Select Data Rate from the drop down list. Data rate will affect the efficiency of the throughput. A lower data rate will allow for transmissions to travel longer distances.
Transmit Power	Select Transmit Power to increase or decrease the transmit power. Altering the transmit power will change the wireless coverage area correspondingly; however, setting the Transmit Power to an extreme level may cause issues for wireless connectivity.
RTS/CTS Threshold	Specify Threshold package size for RTC/CTS. Smaller thresholds will cause RTS/CTS packets to be sent more often, consuming more of the available bandwidth. In addition, if heavy traffic occurs, the wireless network is more robust in the event of interference or collisions.
Distance	Specify distance range between AP and Clients. Farther distances may utilize lower connection speeds.
Short GI	Short GI is an improvement of 802.11n and 802.11b/g. It can increase performance by 10% during the data transmission. For example, if the 802.11b/g's GI is 800μs, the short GI will be 400μs. The shorter guard interval results in a higher packet collision rate

	when the delay-spread of the channel exceeds the guard interval or if timing synchronization between the transmitter and receiver is not precise.
Aggregation	Aggregation is to merge the typical size of data's header to one data. It is useful for the small size but more packets.
Wireless Traffic Shaping	Place a **check** to enable Wireless Traffic Shaping function.
Incoming Traffic Limit	Specify the wireless transmission speed for incoming traffic.
Outgoing Traffic Limit	Specify the wireless transmission speed for outgoing traffic.
Accept / Cancel	Press **Accept** to confirm the changes or **Cancel** to return previous settings.

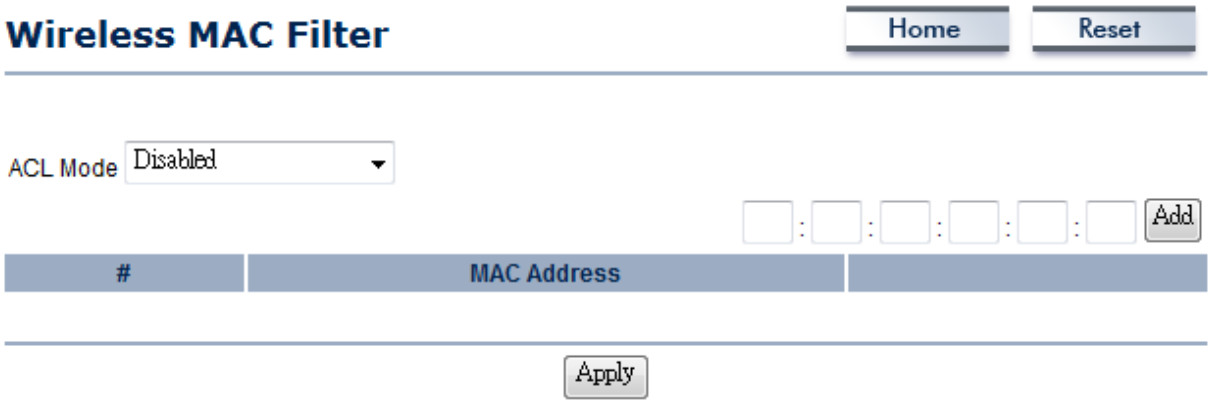
Please make note of the following:

1. Accept does not apply the changes – you must go to Status -> Save / Load to apply the new settings. Please refer to Chapter 4.1 for more information.

2. Changing Wireless Advanced Settings may lower the wireless connection quality. Please keep all settings as default unless you understand the modifications which you have made.

7.4 Wireless MAC Filter

Wireless MAC Filter is used to Allow or Deny wireless clients, by their MAC addresses, from accessing the network. You can manually add a MAC address to restrict the access permission's of the client. The default setting is Disable Wireless MAC Filters.

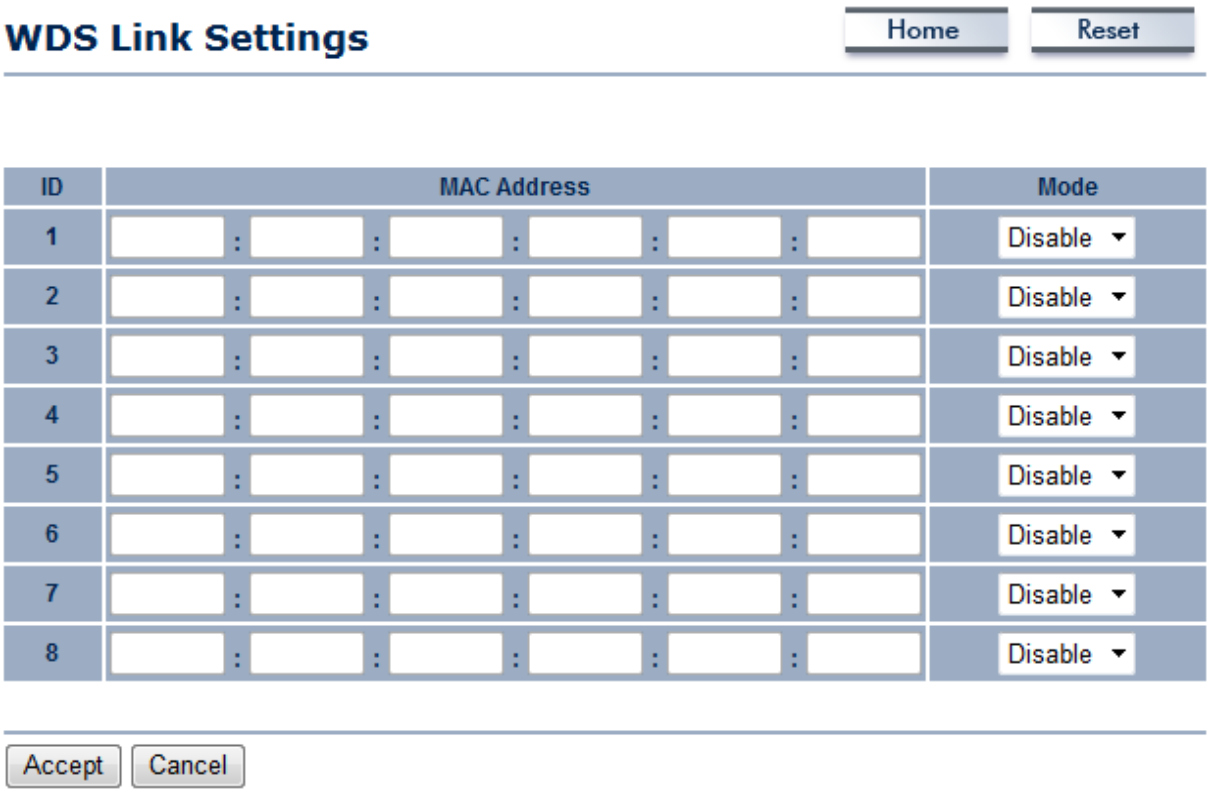


0.

ACL Mode	ACL Mode can deny or allow specific clients to access the network. Select **Disable**, **Deny MAC** in the list, or **Allow MAC** in the list from the drop down list.
MAC Address Filter	Specify the MAC address, manually.
Add	Press **Add** to add the MAC address in the table.
Apply	Press **Apply** to apply the changes.

7.5 WDS Link Settings

WDS Link Settings is used to establish a connection between Access Points without forgoing Access Point functionality. APs with WDS functionality can extend the wireless coverage and allow LANs to communicate with each other.



MAC Address	Enter the Access Point's MAC address that you would like to extend the wireless coverage of into the MAC address filter.
Mode	Select **Disable** or **Enable** from the drop down list.
Accept / Cancel	Press **Accept** to confirm the changes or **Cancel** to return previous settings.

CAUTION **Accept does not apply the changes – you must go to Status -> Save / Load to apply the new settings. Please refer to Chapter 4.1 for more information.**

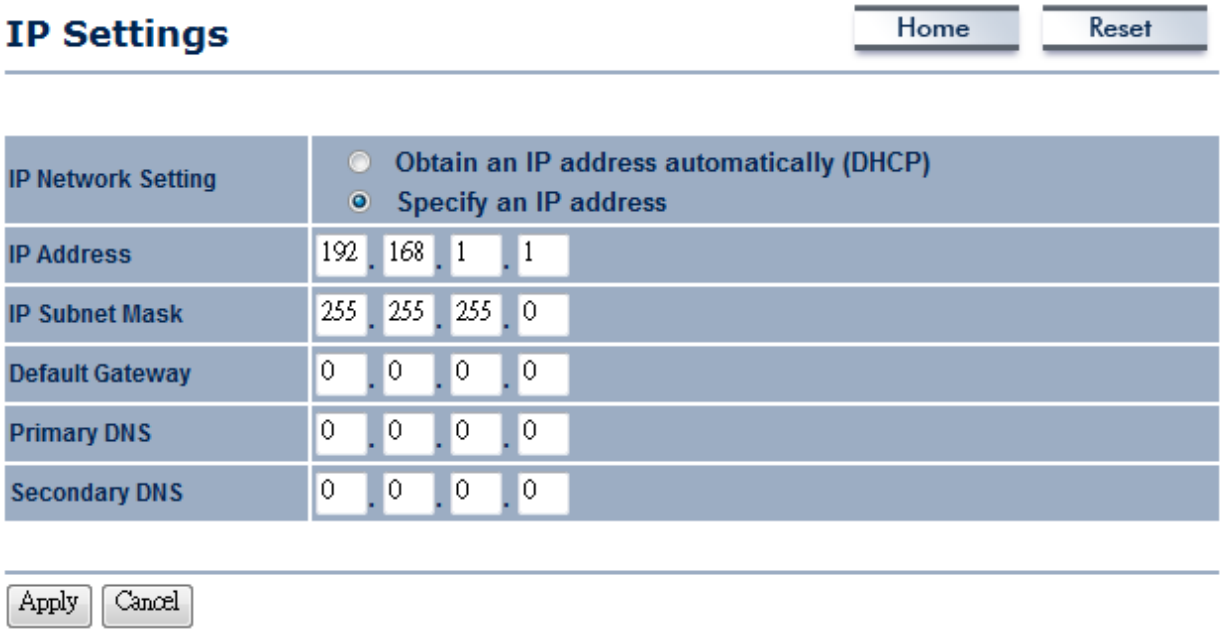
NOTE The MAC address of the AP that you would like to extend the wireless coverage of must be entered. Not all Access Points supports this feature.

8 LAN Setup

This section will guide you to setup the Local Area Network (LAN) settings

8.1 IP Settings

This section is only available for **Non-Router Mode**. IP Settings allows you to configure the IP settings of the ENH202.



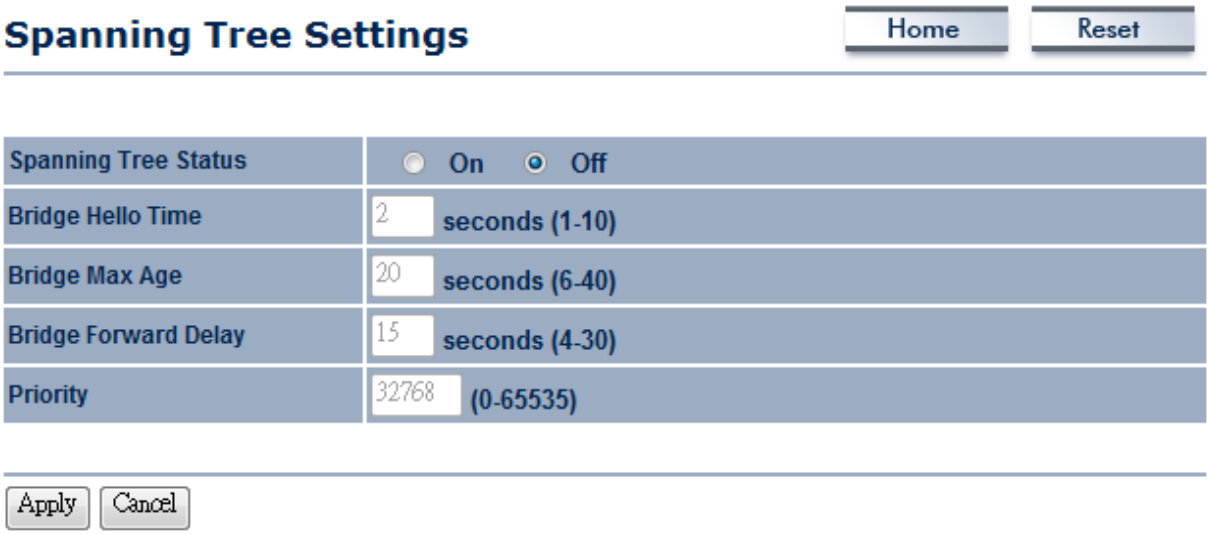
IP Network Setting	Select Radio button for **Obtain an IP address automatically** or **Specify an IP address**.
IP Address	Specify LAN port IP address.
IP Suet Mask	Specify Subnet Mask.
Default Gateway	Specify Default Gateway.
Primary DNS	Specify Primary DNS.
Secondary DNS	Specify Secondary DNS.
Accept / Cancel	Press **Accept** to confirm the changes or **Cancel** to return previous settings.

Please make note of the following:

1. Obtain an IP address automatically is not a DHCP server. This setting allows the ENH202 to automatically request an IP address when it is connected to a device which has a DHCP server.

2. Changing LAN IP Address will change LAN Interface IP address. The webpage will automatically redirect to the new IP address after Apply is selected.

8.2 Spanning Tree Settings



Spanning Tree Status	Select the Radio button to **On** or **Off** to toggle the Spanning Tree function.
Bridge Hello Time	Specify Bridge Hello Time in seconds.
Bridge Max Age	Specify Bridge Max Age in seconds.
Bridge Forward Delay	Specify Bridge Forward Delay in seconds.
Priority	Specify the Priority number; smaller numbers have greater priority.
Accept / Cancel	Press **Accept** to confirm the changes or **Cancel** to return previous settings.

Accept does not apply the changes – you must go to Status -> Save / Load to apply the new settings. Please refer to Chapter 4.1 for more information.

9 Router Settings

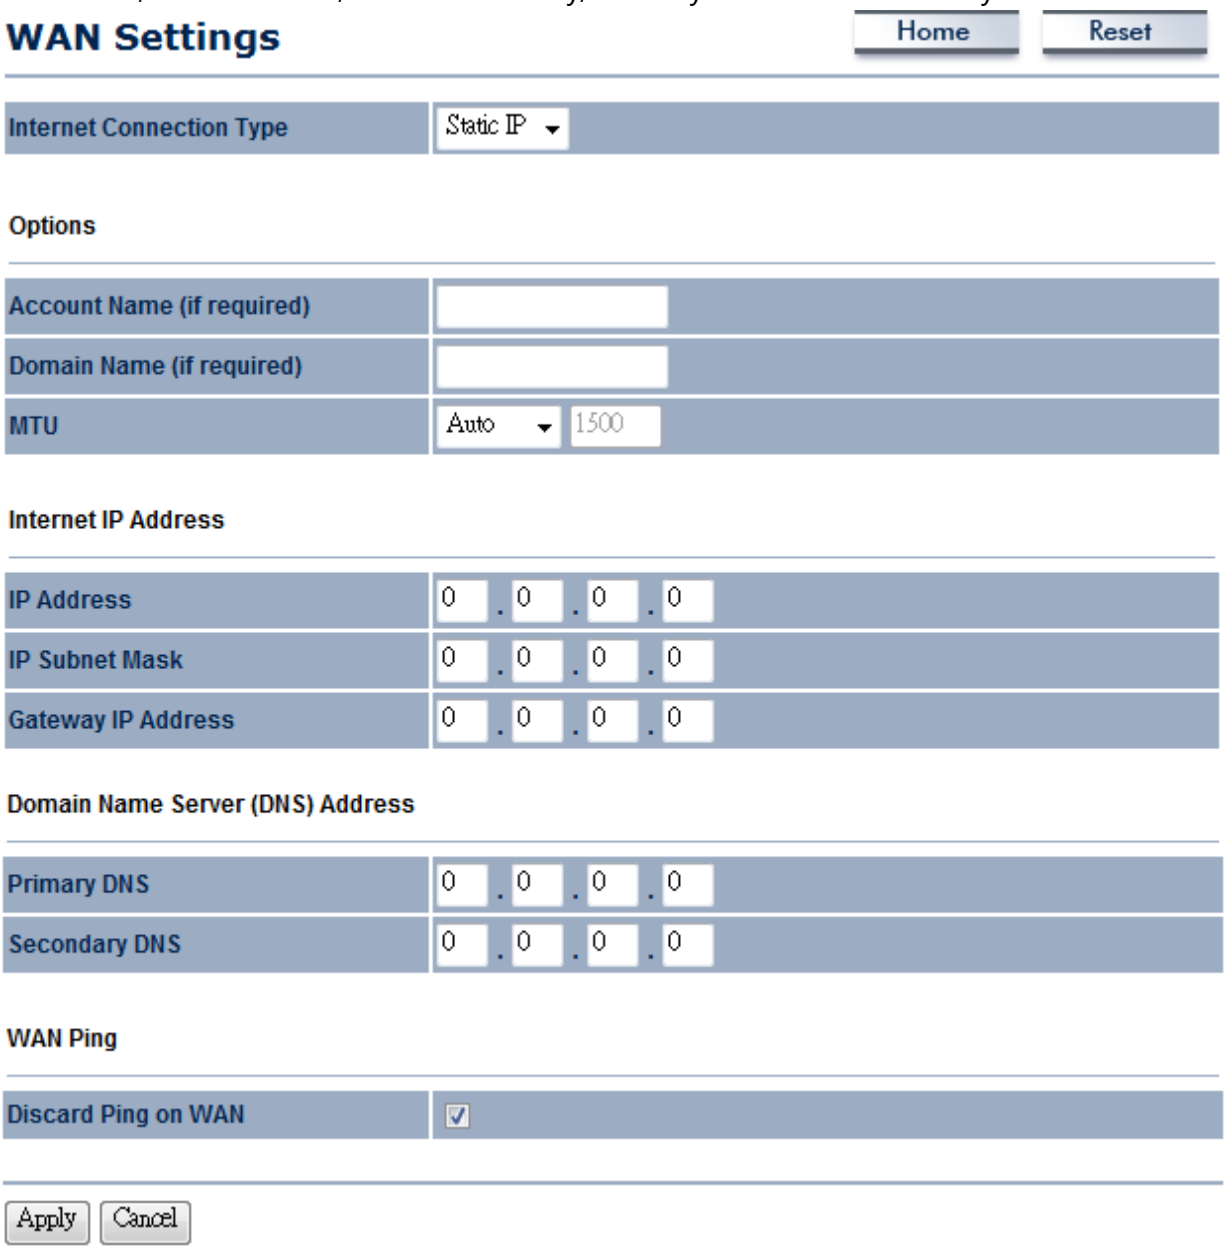
This section is only available for **AP Router Mode** and **Client Router Mode**.

9.1 WAN Settings

There are four different types of WAN connections: Static IP, DHCP, PPPoE, and PPTP. Please contact your ISP to determine the connection type.

9.1.1 Static IP

Select **Static IP** in WAN connection if your ISP gives all the of the necessary information about IP address, Subnet Mask, Default Gateway, Primary DNS and Secondary DNS.



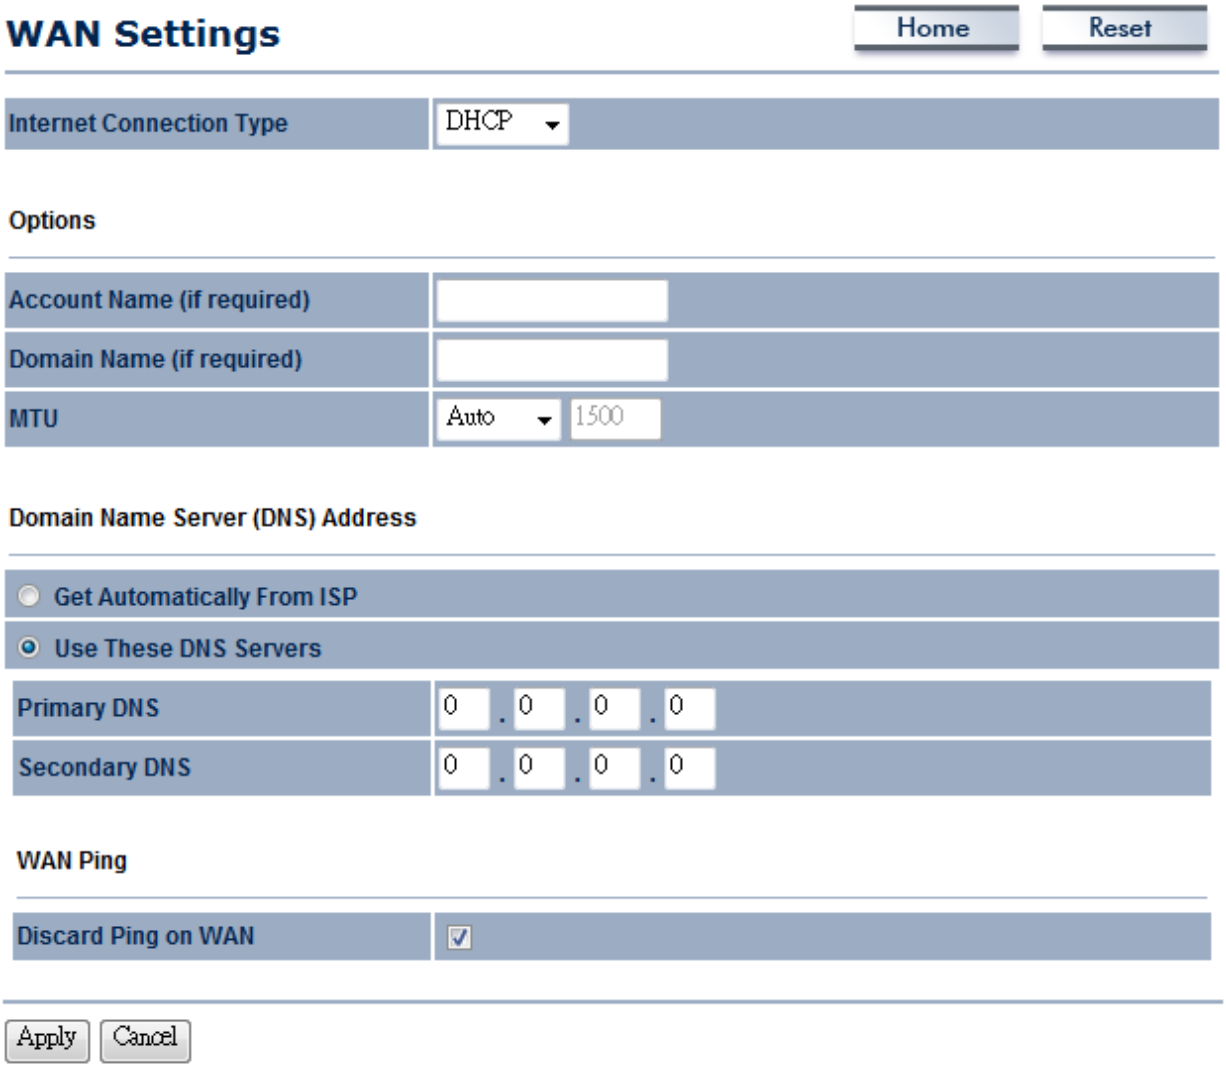
Internet Connection Type	Select **Static IP** to begin configuration of the Static IP connection.
Account Name	Specify Account Name that is provided by ISP.
Domain Name	Specify Domain Name that is provided by ISP.
MTU	Specify the Maximum Transmit Unit size. EnGenius recommends that it remains in Auto.
IP Address	Specify WAN port IP address.
IP Subnet Mask	Specify WAN IP Subnet Mask.
Gateway IP Address	Specify WAN Gateway IP address.
Primary DNS	Specify Primary DNS IP.
Secondary DNS	Specify Secondary DNS IP.
Discard Ping on WAN	Place a **check** to **Enable** or **Disable** ping from WAN.
Accept / Cancel	Press **Accept** to confirm the changes or **Cancel** to return previous settings.

Accept does not apply the changes – you must go to Status -> Save / Load to apply the new settings. Please refer to Chapter 4.1 for more information.

If the router's MTU is set too high, downstream packets will be fragmented. If the router's MTU is set too low, the router will fragment packets unnecessarily and, in extreme cases, may be unable to establish connections. In either case, network performance can suffer.

9.1.2 DHCP (Dynamic IP)

Select **DHCP** as your WAN connection type to obtain the IP address automatically. You will need to enter Account Name as your hostname and DNS addresses (Optional).



Internet Connection Type	Select **DHCP** to begin configuration of the DHCP connection.
Account Name	Specify Account Name which is provided by ISP.
Domain Name	Specify Domain Name which is provided by ISP.
MTU	Specify the Maximum Transmit Unit size. EnGenius recommends that it remains in Auto.
Get Automatically From ISP	Select the Radio button for the DNS servers to be obtained automatically from the DHCP server.
Use These DNS Servers	Select the Radio button to setup the **Primary DNS** and

	Secondary DNS servers manually.
Discard Ping on WAN	Place a **check** to **Enable** or **Disable** ping from WAN.
Accept / Cancel	Press **Accept** to confirm the changes or **Cancel** to return previous settings.

Accept does not apply the changes – you must go to Status -> Save / Load to apply the new settings. Please refer to Chapter 4.1 for more information.

If the router's MTU is set too high, downstream packets will be fragmented. If the router's MTU is set too low, the router will fragment packets unnecessarily and, in extreme cases, may be unable to establish connections. In either case, network performance can suffer.

9.1.3 PPPoE (Point-to-Point Protocol over Ethernet)

Select **PPPoE** as your WAN connection type if your ISP provides a Username and Password. If the PPPoE is a DSL service, please remove the PPPoE software from your computer as the software is not necessary with the use of the ENH202.

Internet Connection Type	Select **PPPoE** to begin configuration of the PPPoE connection.
MTU	Specify the Maximum Transmit Unit size. EnGenius recommends that it remains in Auto.
Login	Specify the **Username** that is given by your ISP.
Password	Specify the **Password** that is given by your ISP.
Service Name	Specify the **Service Name** that is given by your ISP.

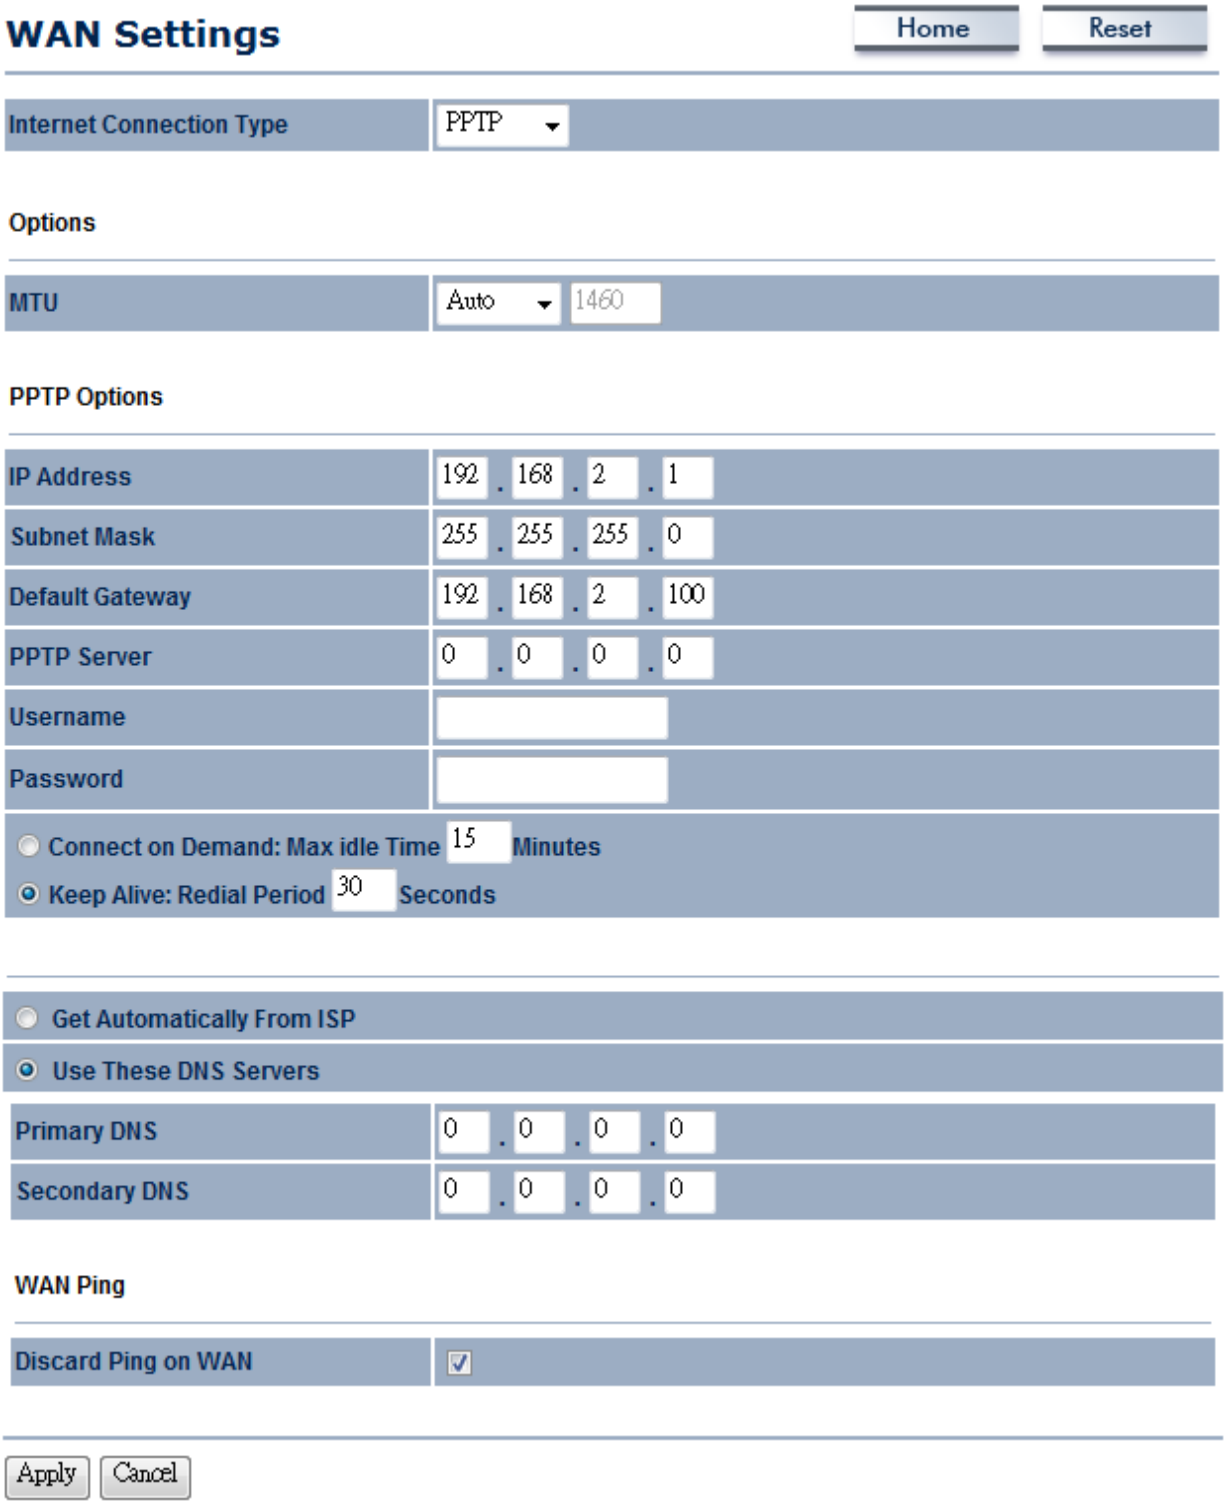
Connect on Demand	Select the Radio button to specify the maximum idle time. The Internet will disconnect when it reaches the maximum idle time; however, it will automatically connect when a client tries to access the network.
Keep Alive	Select the Radio button to keep internet connection always on. Specify the redial period for once the Internet connection is lost.
Get Automatically From ISP	Select the Radio button for the DNS servers to be obtained automatically from the DHCP server.
Use These DNS Servers	Select the Radio button for setup the **Primary DNS** and **Secondary DNS** servers manually.
Discard Ping on WAN	Place a **check** to **Enable** or **Disable** ping from WAN.
Accept / Cancel	Press **Accept** to confirm the changes or **Cancel** to return previous settings.

Accept does not apply the changes – you must go to Status -> Save / Load to apply the new settings. Please refer to Chapter 4.1 for more information.

If the router's MTU is set too high, downstream packets will be fragmented. If the router's MTU is set too low, the router will fragment packets unnecessarily and, in extreme cases, may be unable to establish connections. In either case, network performance can suffer.

9.1.4 PPTP (Point-to-Point Tunneling Protocol)

Select **PPTP** as your WAN connection type if your ISP provides information regarding: IP Address, Subnet Mask, Default Gateway (Optional), DNS (Optional), Server IP, Username, and Password.

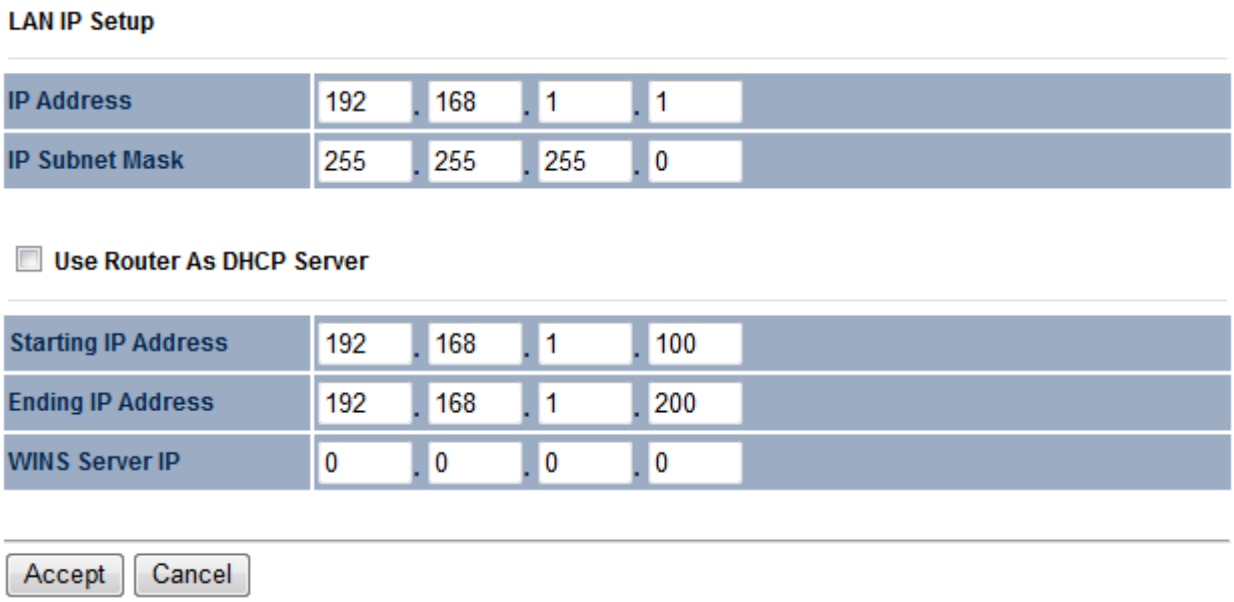


Internet Connection Type	Select **PPTP** to begin configuration of the PPTP connection.
MTU	Specify the Maximum Transmit Unit size. EnGenius recommends that it remains in Auto.
IP Address	Specify WAN port IP address.
IP Subnet Mask	Specify WAN IP Subnet Mask.
Gateway IP Address	Specify WAN Gateway IP address.
PPTP Server	Specify PPTP Server IP address.
Username	Specify the **Username** that is given by your ISP.
Password	Specify the **Password** that is given by your ISP.
Connect on Demand	Select the Radio button to specify the maximum idle time. The Internet will disconnect when it reaches the maximum idle time; however, it will automatically connect when a client tries to access the network.
Keep Alive	Select the Radio button to keep internet connection always on. Specify the redial period once the internet lose connection.
Get Automatically From ISP	Select the Radio button for the DNS servers to be obtained automatically from the DHCP server.
Use These DNS Servers	Select the Radio button for setup the **Primary DNS** and **Secondary DNS** servers manually.
Discard Ping on WAN	Place a **check** to **Enable** or **Disable** ping from WAN.
Accept / Cancel	Press **Accept** to confirm the changes or **Cancel** to return previous settings.

Accept does not apply the changes – you must go to Status -> Save / Load to apply the new settings. Please refer to Chapter 4.1 for more information.

If the router's MTU is set too high, downstream packets will be fragmented. If the router's MTU is set too low, the router will fragment packets unnecessarily and, in extreme cases, may be unable to establish connections. In either case, network performance can suffer.

9.2 LAN Settings (Router Mode)



IP Address	Specify LAN port IP address.
IP Subnet Mask	Specify LAN IP Subnet Mask.
WINS Server IP	Specify WINS Server IP.
Use Router As DHCP Server	Place a **check** to enable the DHCP server.
Starting IP Address	Specify DHCP server starting IP address.
Ending IP Address	Specify DHCP server ending IP address.
WINS Server IP	Specify the WINS Server IP address.
Accept / Cancel	Press **Accept** to confirm the changes or **Cancel** to return previous settings.

Accept does not apply the changes – you must go to Status -> Save / Load to apply the new settings. Please refer to Chapter 4.1 for more information.

9.3 VPN Pass Through

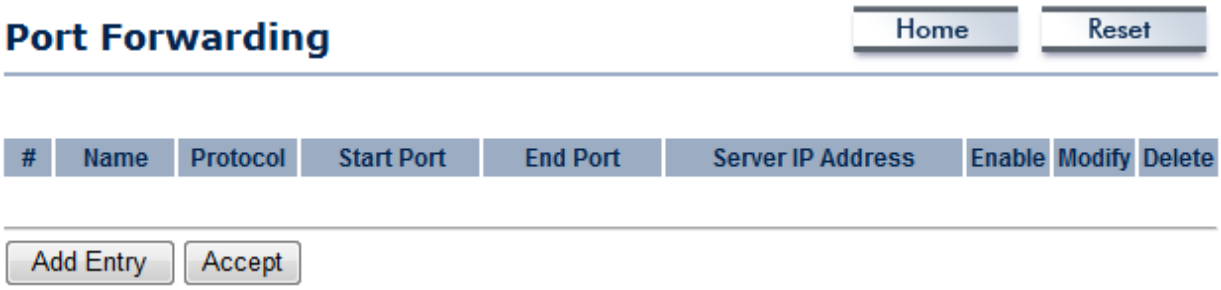
VPN Pass Through is used to allow certain protocols to be tunneled through an IP network such as PPTP and L2TP, or to implement a secure exchange of packets at the IP Layer such as IPSec.

PPTP Pass Through	Place a **check** to enable PPTP protocol passes through WAN.
L2TP Pass Through	Place a **check** to enable L2TP protocol passes through WAN.
IPSec Pass Through	Place a **check** to enable IPSec protocol passes through WAN.
Accept / Cancel	Press **Accept** to confirm the changes or **Cancel** to return previous settings.

CAUTION **Accept does not apply the changes – you must go to Status -> Save / Load to apply the new settings. Please refer to Chapter 4.1 for more information.**

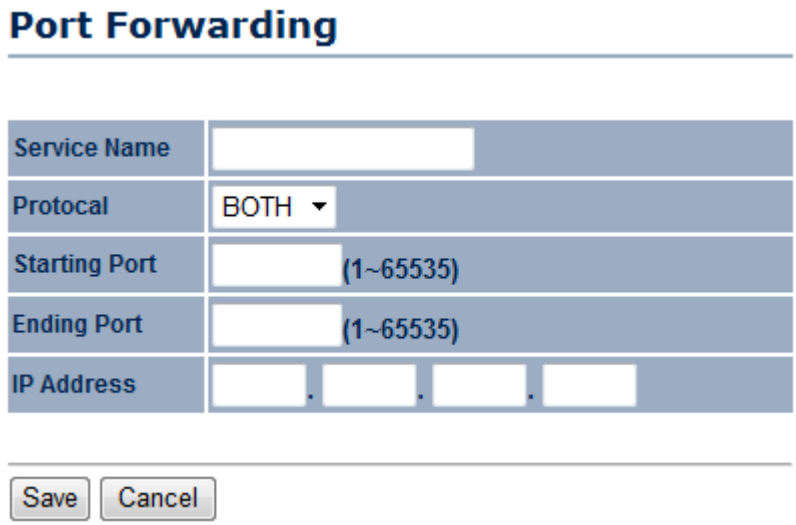
9.4 Port Forwarding

Port Forwarding is used to allow public services such as Web Server, Mail Server, or FTP server to be set up. For example: Set up a Web Server on your computer with port number **8080**. A visitor on the Internet can access your Web Server by entering **WAN Port IP** with port number **8080**. If the WAN Port IP address is 192.168.5.1, then visitors must enter **http://192.168.5.1:*8080***. To find out more about common port numbers please consult the Internet.



Add Entry	Press **Add Entry** to add a rule of Port Forwarding.
Accept	Press **Accept** to confirm the changes.

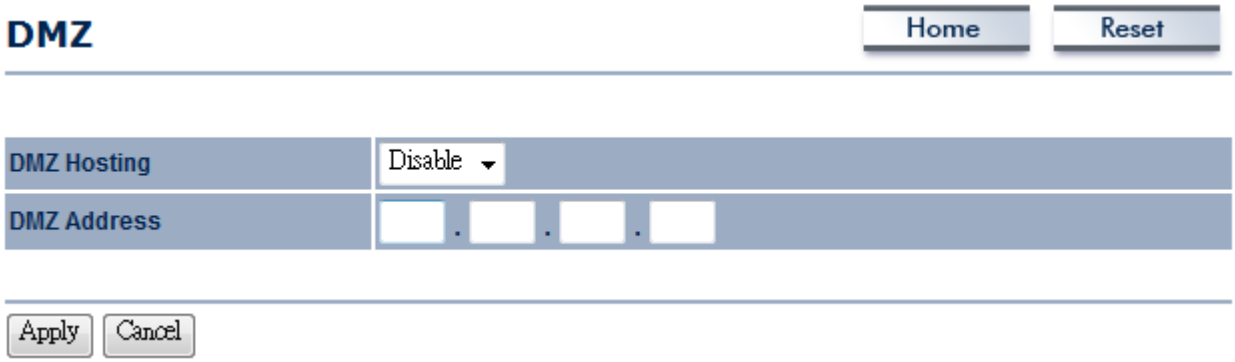
Accept does not apply the changes – you must go to Status -> Save / Load to apply the new settings. Please refer to Chapter 4.1 for more information.



Service Name	Specify a name for current Port Forwarding rule.
Protocol	Select a protocol from drop down list: **Both**, **TCP**, or **UDP**.
Starting Port	Specify Starting Port number.
Ending Port	Specify Ending Port number.
IP Address	Specify IP address.
Save / Cancel	Press **Save** to confirm the changes or **Cancel** to return previous settings.

9.5 DMZ

Enabling DMZ will expose the computer which is in the DMZ to the Internet. This feature may be used in scenarios such as Internet Gaming or Video Conferencing. DMZ will forward all the ports to one PC simultaneously. This PC will be vulnerable to any incoming traffic, including unsolicited or malicious traffic, because DMZ opens all of the ports.



DMZ Hosting	Select **Enable** or **Disable** DMZ from drop down list.
DMZ Address	Specify an IP address of DMZ.
Accept / Cancel	Press **Accept** to confirm the changes or **Cancel** to return previous settings.

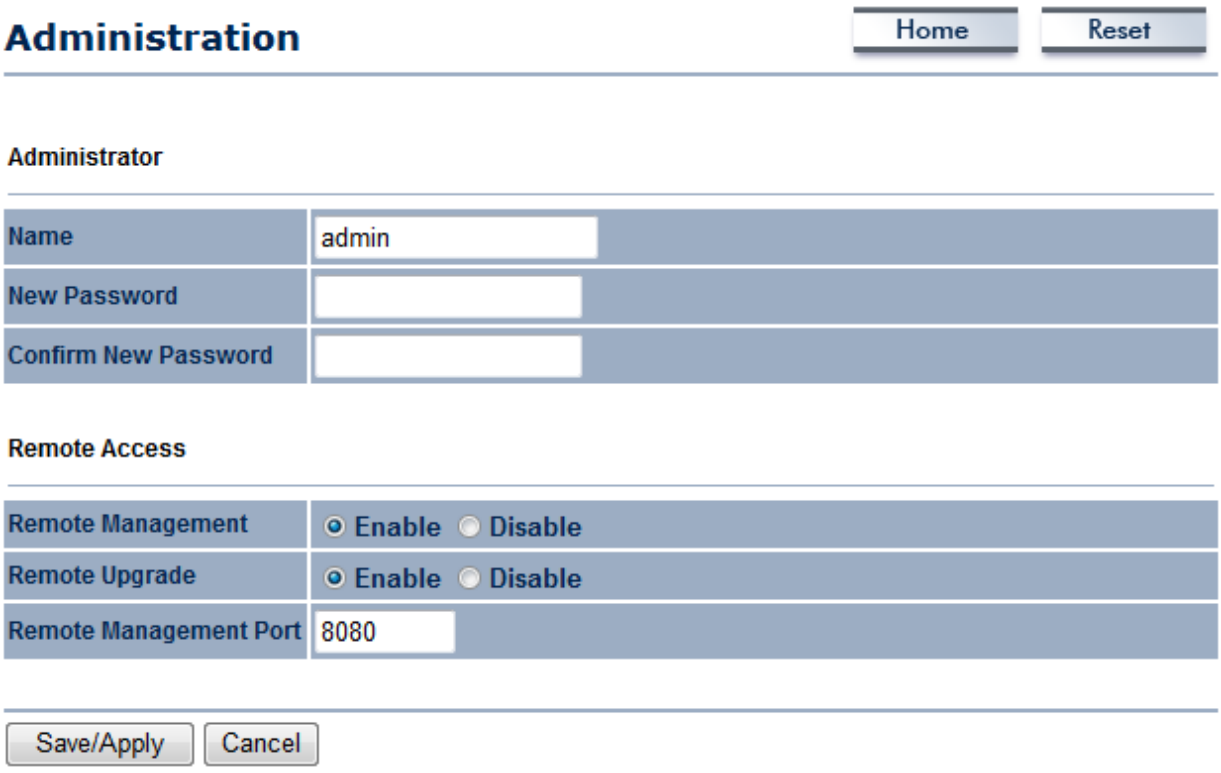
Accept does not apply the changes – you must go to Status -> Save / Load to apply the new settings. Please refer to Chapter 4.1 for more information.

10 Management Settings

The **Management** section is on the navigation drop-down menu. You will see seven options: Administration, Management VLAN, SNMP Settings, Backup / Restore Settings, Firmware Upgrade, Time Settings, and Log. Each option is described below.

10.1 Administration

Click on the **Administration** link under the **Management** menu. This option allows you to create a user name and password for the device. By default, this device is configured with a username and password of **admin**. For security reasons it is highly recommended that you create a new user name and password.



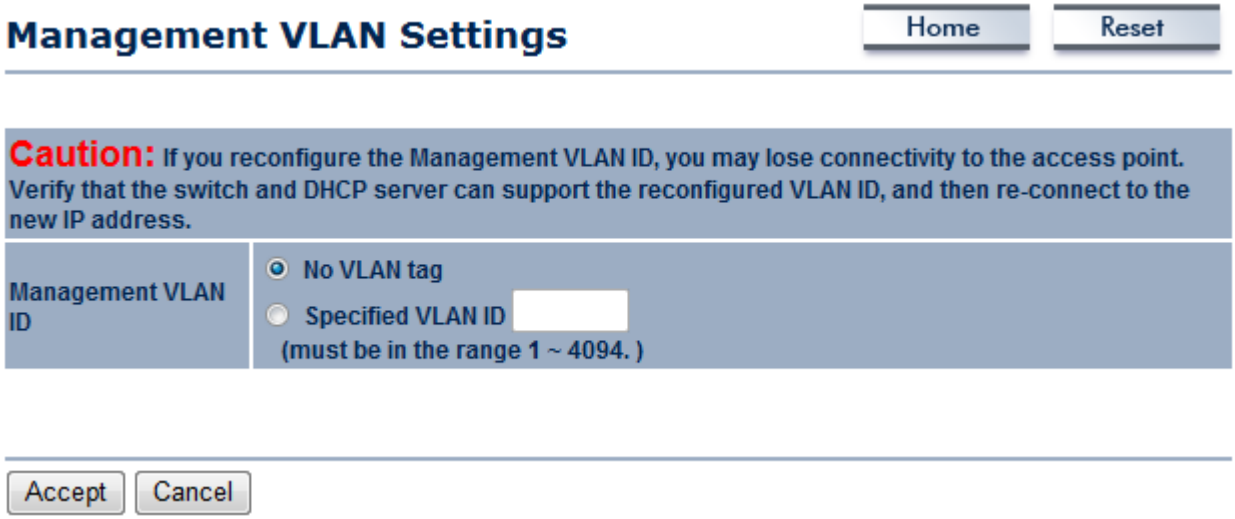
Name	Specify Username for login.
Password	Specify a Password for login
Confirm Password	Re-enter the Password for confirmation.
Remote Management	Select the **Radio** button to **Enable** or **Disable** Remote Management.
Remote Upgrade	Select the **Radio** button to **Enable** or **Disable** Remote Upgrade.
Remote Management	Specify the **Port** number for Remote Management. For example:

Port	if you specify the Port number is 8080, then you will need to enter the following http://**IP address**:8080 to access the web interface.
Save / Apply / Cancel	Press **Save / Apply** to confirm the changes or **Cancel** to return previous settings.

Pressing Save / Apply will change the settings immediately. It is not reversible unless the settings are changed again or the device is reset.

10.2 Management VLAN

Click on the **Management VLAN** link under the **Management** menu. This option allows you to assign a VLAN tag to packets. A VLAN is a group of computers on a network whose software has been configured so that they behave as if they were on a separate Local Area Network (LAN). Computers on a VLAN do not have to be physically located next to one another on the LAN.



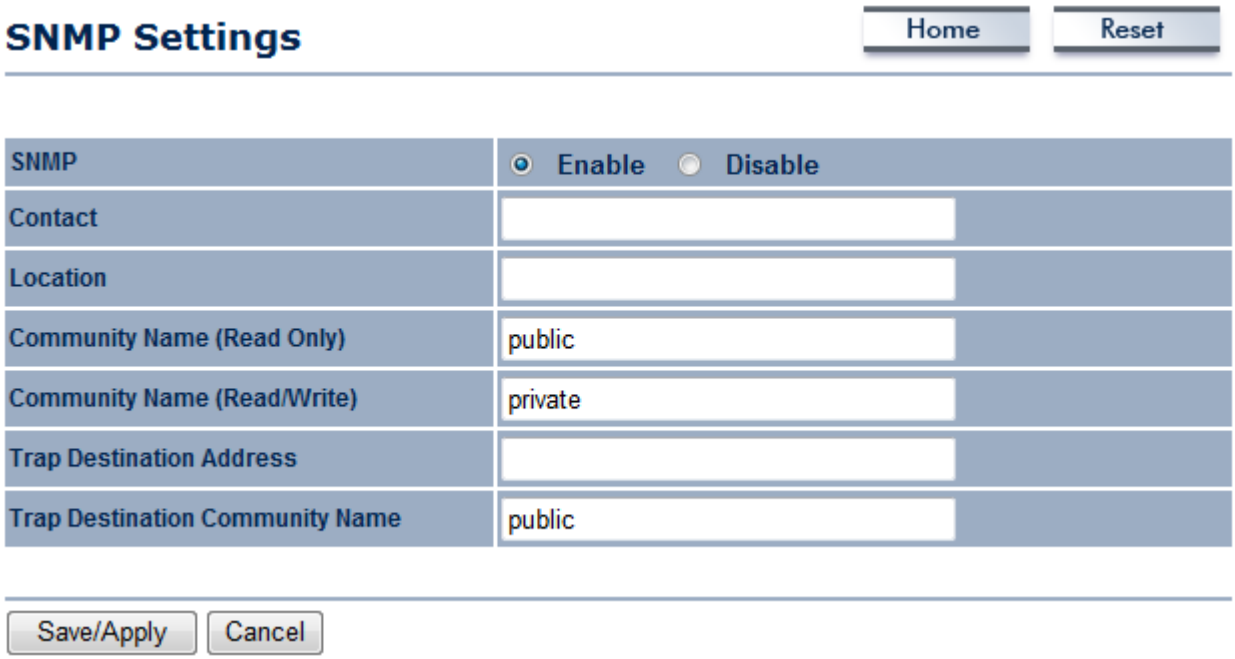
Management VLAN ID	If your network includes VLANs and if tagged packets need to pass through the Access Point, specify the VLAN ID in this field. If not, select the **No VLAN tag** radio button.
Accept / Cancel	Press **Accept** to confirm the changes or **Cancel** to return previous settings.

Please make note of the following:

1. Accept does not apply the changes – you must go to Status -> Save / Load to apply the new settings. Please refer to Chapter 4.1 for more information.
2. If you reconfigure the Management VLAN ID, you may lose connection to the ENH202. Verify the DHCP server can support the reconfigured VLAN ID, and then re-connect to the new IP address.

10.3 SNMP Settings

Click on the **SNMP Settings** link under the **Management** menu. This is a networking management protocol used to monitor network-attached devices. SNMP allows messages [called protocol data units] to be sent to various parts of a network. Upon receiving these messages, SNMP-compatible devices [called agents] return data stored in their Management Information Databases.

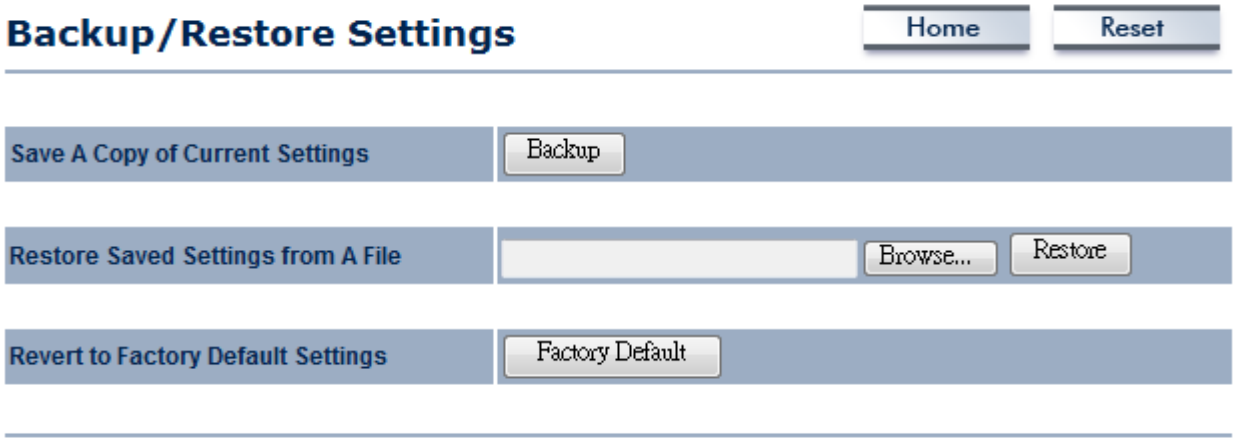


SNMP Enable/Disable	Select the **Radio** button to **Enable** or **Disable** SNMP function.
Contact	Specify the contact details of the device.
Location	Specify the location of the device.
Community Name	Specify the password for access the SNMP community for read only access.
Community Name	Specify the password for access the SNMP community for read and write access.
Trap Destination IP Address	Specify the IP address that will receive the SNMP trap.
Trap Destination Community Name	Specify the password of the SNMP trap community.
Save / Apply / Cancel	Press **Save / Apply** to confirm the changes or **Cancel** to return previous settings.

Accept does not apply the changes – you must go to Status -> Save / Load to apply the new settings. Please refer to Chapter 4.1 for more information.

10.4 Backup/Restore Settings

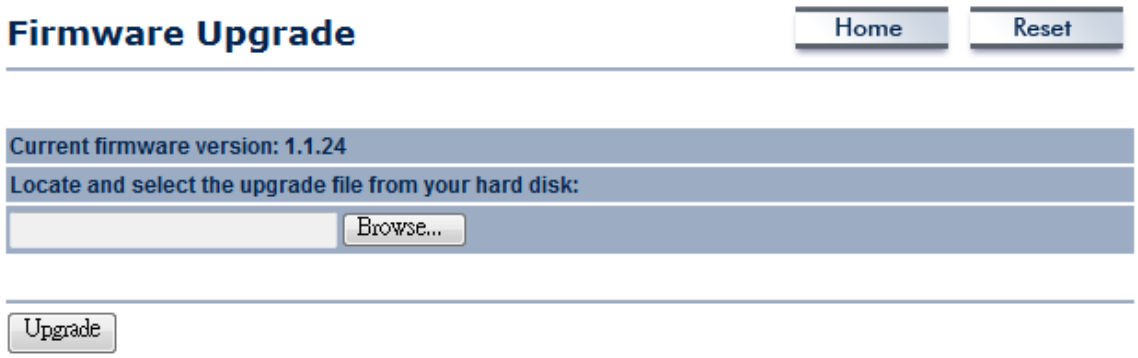
Click on the **Backup/Restore Setting** link under the **Management** menu. This option is used to save the current settings of the device in a file on a storage device, or to load settings on to the device from storage device. This feature is very useful for administrators who have several devices that need to be configured with the same settings.



Save A Copy of Current Settings	Click on **Backup** to save current configured settings.
Restore Saved Settings from a File	ENH202 can restore a previous setting that has been saved. Click on Browse to select the file and Restore.
Revert to Factory Default Settings	Click on **Factory Default** button to reset all the settings to the factory default values.

10.5 Firmware Upgrade

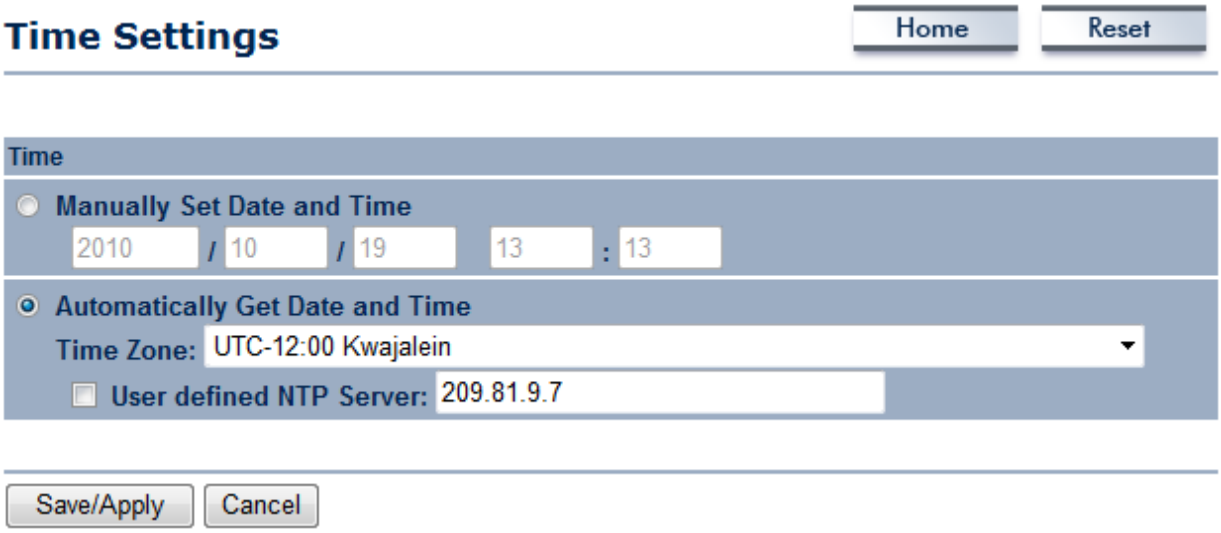
Click on the **Firmware Upgrade** link under the **Management** menu. This page is used to upgrade the firmware of the device. Make sure that to download the appropriate firmware from EnGenius.



The upgrade process may take few minutes. Please do not power off the device as this may cause the device to crash or become unusable. The ENH202 will restart automatically once the upgrade is complete.

10.6 Time Settings

Click on the **Time Settings** link under the **Management** menu. This page allows you to configure the time on the device. You may do this manually or by connecting to a NTP server.



Manually Set Date and Time	Manually setup the date and time.
Automatically Get Date and Time	Specify the **Time Zone** from the drop down list and Place a **check** to specify the IP address of the NTP Server manually or use the default NTP Server.
Save / Apply / Cancel	Press **Save / Apply** to confirm the changes or **Cancel** to return previous settings.

Pressing Save / Apply will change the settings immediately. It is not reversible unless the settings are changed again or the device is reset.

10.7 Log

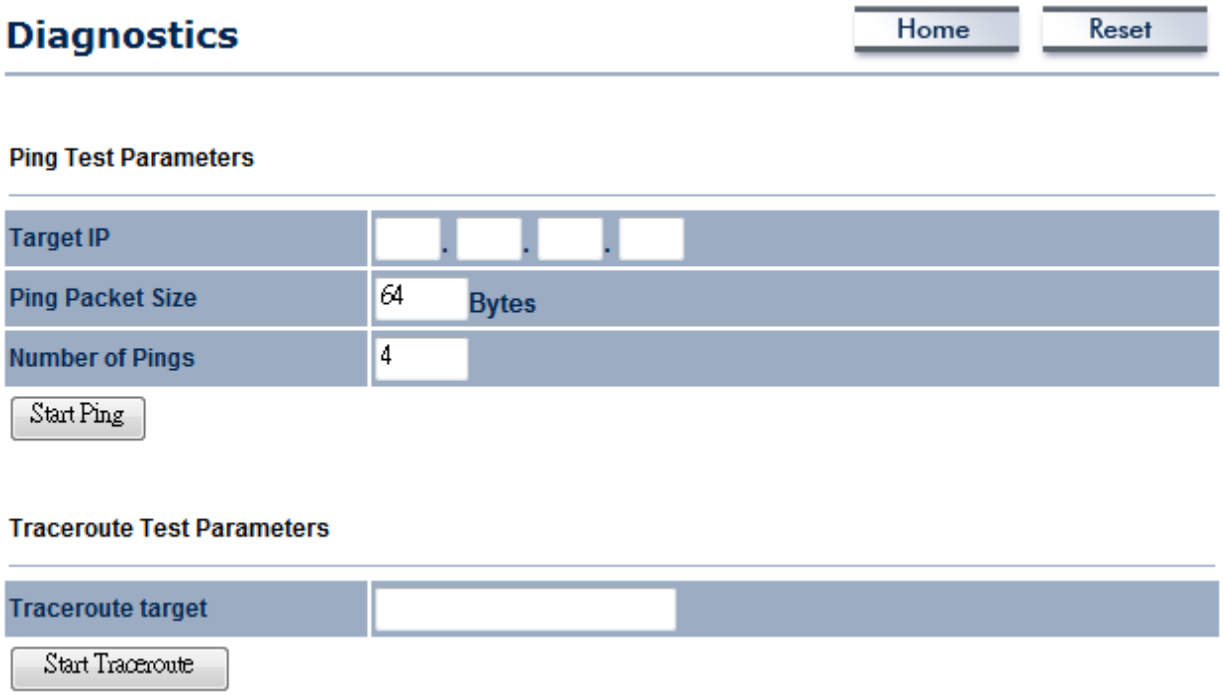
Click on the **Log** link under the **Management** menu. This page displays a list of events that are triggered on the Ethernet and Wireless interface. This log can be referred to when an error occurs on the system or when a report needs to be sent to the technical support department for debugging purposes.

Syslog	Select **Enable** or **Disable** Syslog function from the drop down list.
Log Server IP Address	Specify the Log Server IP address.
Local Log	Select **Enable** or **Disable** Local Log service.
Save/Apply / Cancel	Press **Save / Apply** to confirm the changes or **Cancel** to return previous settings.

Pressing Save / Apply will change the settings immediately. It is not reversible unless the settings are changed again or the device is reset.

10.8 Diagnostics

Click on the **Diagnostics** link under the **Management** menu. This function allows you to detect connection quality and trace the routing table to the target.

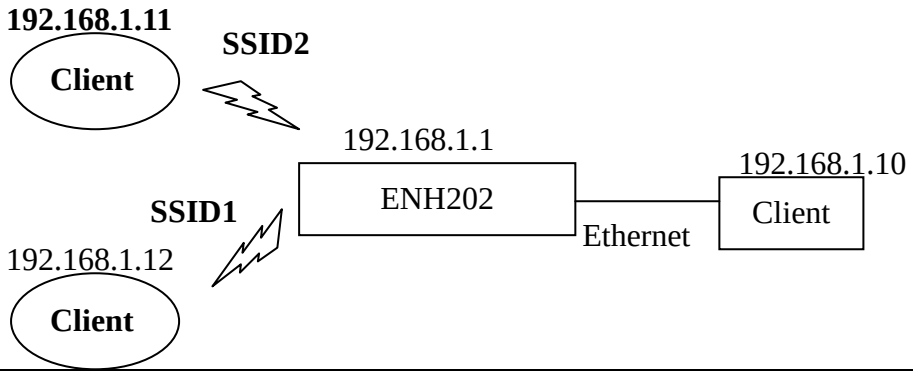


Target IP	Specify the IP address you would like to search.
Ping Packet Size	Specify the packet size of each ping.
Number of Pings	Specify the number of pings.
Start Ping	Press **Start Ping** to begin.
Traceroute Target	Specify an IP address or Domain name that you want to trace.
Start Traceroute	Press **Start Traceroute** to begin.

11 Network Configuration Examples

This chapter describes the role of the ENH202 with 4 modes. The Access Point mode's default configuration is a central unit of the wireless network or as a root device of the wired environment. Repeater Mode and Mesh Network Mode need additional configuration.

11.1 Access Point



Access Point	
Step 1	Login to the web-based configuration interface with default IP 192.168.1.1
Step 2	Select your country or region's regulation.
Step 3	Use site survey to scan channels of the nearby area.
Step 4	Select a channel with less interference.
Step 5	Specify the SSID for your broadcast SSID and you can also configure multiple SSID at the same time.
Step 6	Verify VLAN identifier in order to separate services among clients
Step 7	Setup the authentication settings.
Step 8	Select Apply to process all of the configurations.

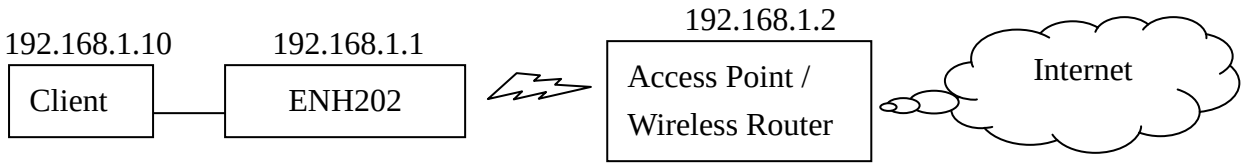
NOTE For more advanced settings, please refer to the previous chapters.

Wireless Client	
Step 1	Select the Wireless Mode you would like to associate with.
Step 2	Use Site Survey to scan for nearby Access Points and select the AP that you would like to connect with or enter the SSID manually.
Step 3	Configure VLAN ID in your wireless device if available.
Step 4	Select the correct authentication type and password.

CAUTION **The ENH202's Access Point Mode does not provide a DHCP server so the Wireless Client IP address must be configured manually in Local Area Network Settings.**

11.2 Client Bridge Mode

Client Bridge Mode functions like a wireless dongle. It must connect to an Access Point/AP Router to join the network.



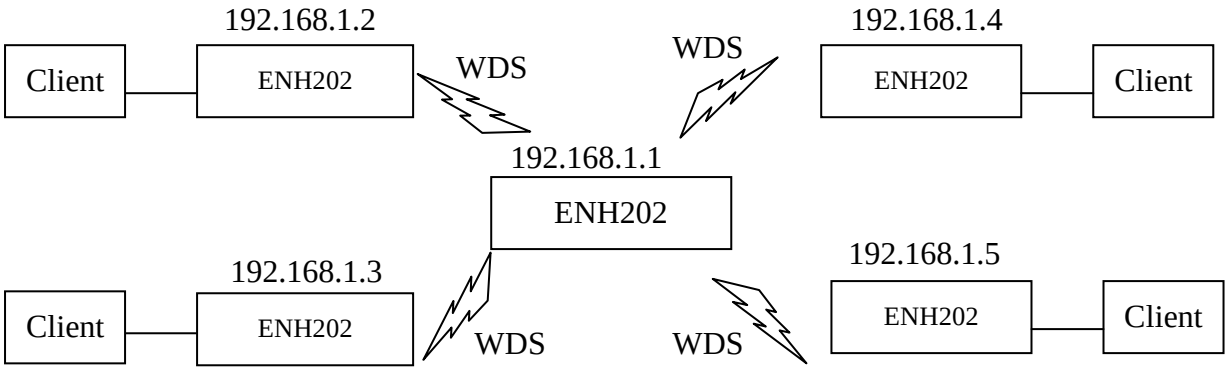
NOTE Please refer to the last section to check the Access Point's configuration.

Client Bridge	
Step 1	Login to the web-based configuration interface with the default IP: 192.168.1.1
Step 2	Select your country or region's regulation.
Step 3	Select **Operation Mode** to **Client Bridge** from **System Properties**.
Step 4	Use site survey to scan channels of the nearby area.
Step 5	Select the AP that you would like to associate with.
Step 6	Setup the authentication settings that match to the Access Point's settings.
Step 7	Select Apply to process all of the configurations.

TIP The Client-Bridge's IP settings must match the Access Point's settings.

11.3 WDS Bridge Mode

Use this feature to link multiple APs together in a network. All clients associated with any of the APs can communicate with each other similar to an ad-hoc mode. The following configuration shows four ENH202's running on WDS Bridge Mode, which are connected to a main ENH202 that is providing Internet access, also running on WDS Bridge Mode. This is a bridged network; therefore, all nodes on the network can be in the same network IP block. All computers are viewable as if they are in the same location and on the same Ethernet network.

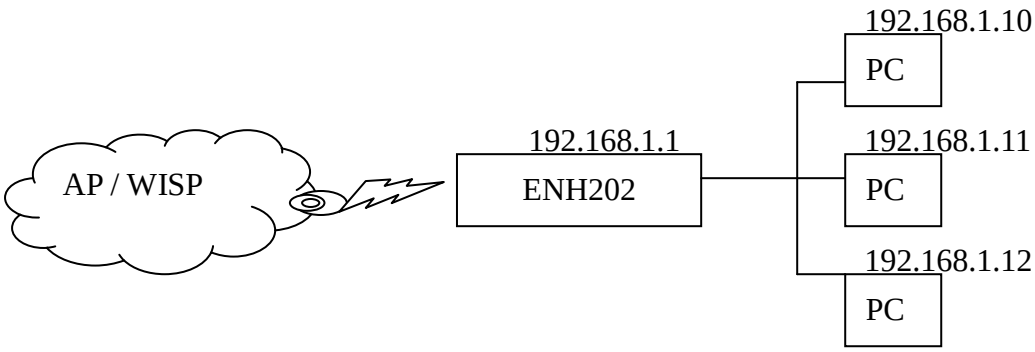


WDS Bridge	
Step 1	Login to the web-based configuration interface with default IP 192.168.1.1
Step 2	Select your country or region's regulation.
Step 3	Change Operation Mode to **WDS Bridge** under **System Properties**.
Step 4	Set the device's IP settings under **System -> IP Settings**
Step 5	Set the WLAN settings under **Wireless Network**.
Step 6	Configure WDS Link Settings under **Wireless**.
Step 7	Specify the MAC address of the AP which you would like to connect with.
Step 8	Press **Apply** under **Save / Reload** to process all of the configurations.
Step 9	Verify the device's settings by browsing to **Status -> Main**. View the WDS link status.

Each WDS bridge device must use the same Subnet, Wireless Mode, Wireless Channel, and Security Setting.

11.4 Client Router Mode

In the Client Router Mode, the ENH202 has a DHCP Server that allows multiple devices to share the same Internet connection. Connect to an AP/WISP wirelessly and connect to LANs via wired. Client Router Mode is functionally opposite to the AP Router Mode.



NOTE Please refer to the last section to check Access point's configuration.

Client Router	
Step 1	Login to the web-based configuration interface with default IP 192.168.1.1
Step 2	Select your country or region's regulation.
Step 3	Select **Operation Mode** to **Client Router** from **System Properties**.
Step 4	Change your **Local Area Network** setting to **Obtain an IP Address Automatically**.
Step 5	Use site survey to scan channels of the nearby area.
Step 6	Select the AP that you would like to associate with.
Step 7	Setup the authentication settings that match the Access Point's settings.
Step 8	Configure your WAN connection type which is given by your **Internet Service Provider** on the **WAN Settings**.
Step 9	Press **Apply** to process all of the configurations.

CAUTION **The Client Router's IP settings must match those of the Access Point's.**

Appendix A – Troubleshooting

This appendix provides problem-solving information you may find useful in case you need to troubleshoot your ENH202. It also includes information about contacting technical support.

A.1 Problem Solving

Question	Answer
How do I reset the ENH202?	There are two ways to reset the ENH202, a hardware method and a software method. Both methods return the ENH202 to its factory default configuration. To use the hardware method, press reset button behind the hole of the PoE injector for 10 seconds; open the cover on the bottom panel of the ENH202 and find the Reset button (see section 2.1). Using a flat object such as a pencil, press the Reset button for approximately 10 seconds and then stop pressing. To use the software method, click **Restore to Factory Default** in the **Management** menu.
Why do I not see traffic pass after I connect the ENH202 to a PoE switch?	The ENH202 uses a proprietary PoE injector and will not work with standard 802.3af-compliant PoE switches.
What is the default IP address of the ENH202?	The default IP address is 192.168.1.1
I plugged the PoE to the Ethernet port on the back of ENH202 but the unit is not on, how come?	You need to plug the Ethernet cable connect to PoE injector, and connect the power adapter comes with the package to the “DC IN” port on the PoE injector
When I install the PoE connection to the ENH202, what kind of PoE should I use?	The ENH202 uses a proprietary PoE injector and will not work with standard 802.3af-compliant PoE switches.

A.2 Contacting Technical Support

If you encounter issues that cannot be resolved using this manual, please contact your vendor where you purchase the device. If you cannot contact your vendor, you may also contact EnGenius Customer Service department in the region where you purchased the device. Before you contact your local EnGenius office, please prepare the following information:

- Product model name and serial number
- The place where you purchased the product
- Warranty information
- The date when you received the product
- A brief description about the issue and the attempts you tried to resolve it

To contact EnGenius Customer Service office in the United States, please use either of the following methods:

- Email: support@EnGeniustech.com
- Telephone: 1-888-735-7888

Appendix B – Specifications

MCU:	Atheros AR7240	
RF:	Atheros AR9283	
Memory:	32 MB	
Flash:	8 MB	
Standard:	802.11 b/g/n	
Physical Interface:	- 1x LAN Port with PoE support - 1x LAN Port - 1x Reset button	
Max. Data rate:	300 Mbps	
LEDs status:	- Power Status - LAN1/LAN2 (10/100Mbps) - WLAN (Wireless is up) - 3 x Link Quality (Client Bridge mode)	
Security:	- WEP Encryption-64/128/152 bit - WPA/WPA2 Personal (WPA-PSK using TKIP or AES) - WPA/WPA2 Enterprise (WPA-EAP using TKIP) - 802.1x Authenticator - Hide SSID in beacons - MAC address filtering, up to 50 field - Wireless STA (Client) connected list	
Power Requirements:	- Active Ethernet (Power over Ethernet) - Proprietary PoE design - Power Adapter 24VAC / 1.0A	
Antenna:	- Internal Directional 10dBi	
Package Contents:	- Wireless Long Range 11N AP/CB (ENH202) - PoE Injector (EPE-24R) - Power Adaptor - CD with User's Manual - QIG - Mounting Set - Special Screw Set	
Certifications:	FCC, CE, IC	
RADIO FREQUENCY BAND		
Channel	**Tx Avg. Power Optimal (dBm)**	**Rx Sensitivity Optimal (dBm)**
802.11b (2.412 ~ 2.472 GHz)		
1 Mbps:	28	-97

2 Mbps:	28	-95
5.5 Mbps:	28	-92
11 Mbps:	28	-89
802.11g (2.412 ~ 2.472 GHz)		
6 Mbps:	28	-96
9 Mbps:	28	-93
12 Mbps:	28	-89
18 Mbps:	28	-85
24 Mbps:	27	-81
36 Mbps:	26	-79
48 Mbps:	25	-76
54 Mbps:	24	-75
802.11n (2.412 ~ 2.472 GHz)		
MCS0 / MCS8:	29	-95
MCS1 / MCS9:	29	-92
MCS2 / MCS10:	29	-87
MCS3 / MCS11:	29	-85
MCS4 / MCS12:	26	-80
MCS5 / MCS13:	25	-79
MCS6 / MCS14:	24	-74
MCS7 / MCS15:	23	-73
ENVIRONMENT & MECHANICAL		
Temperature Range:	Operating -20°C ~ 70°C (-4°F to 158° F) Storage -30°C ~ 80°C (-22° F to 176°F)	
Humidity (non-condensing):	0%～90% typical	
Waterproof:	IP55	

Appendix C – Glossary

Access Point
A base station in a WLAN that act as a central transmitter and receiver of WLAN radio signals.

Ad Hoc Network
A short-term WLAN framework created between two or more WLAN adapters, without going through an Access Point. An ad hoc network lets computers send data directly to and from one another. For an ad hoc network to work, each computer on the network needs a WLAN card installed configured for Ad Hoc mode.

Antenna
A device that sends and receives radio-frequency (RF) signals. Often camouflaged on existing buildings, trees, water towers or other tall structures, the size and shape of antennas are generally determined by the frequency of the signal they manage.

Authentication
A process that verifies the identity of a wireless device or end-user. A common form of authentication is to verify identities by checking a user name and password to allow network access.

Backbone
A high-speed line or series of connections that form a major pathway within a network.

Bandwidth
The part of the frequency spectrum required to transmit desired information. Each radio channel has a center frequency and additional frequencies above and below this carrier frequency that carry the transmitted information. The range of frequencies from the lowest to the highest used is called the bandwidth.

Bridge
A wireless device that connects multiple networks that are physically separate or use different media, but which use similar standards.

Bridge Mode
An Access Pointy in bridge mode can operate as a WLAN bridge that connects two wired network segments. The peer device also must be in bridge mode. This wireless bridge connection is equivalent to a Wireless Distribution System (WDS).

CHAP
Challenge Handshake Authentication Protocol. An alternative protocol that uses a challenge/response technique instead of sending passwords over the wire.

Collision
Interference resulting from two network devices sending data at the same time. The network detects the collision of the two transmitted packets and discards both of them.

Coverage
The region within which a paging receiver can reliably receive the transmission of paging

signals.

Coverage Area

The geographical area that can be served by a mobile communications network or system.

Coverage Hole

An area within the radio coverage footprint of a wireless system where the RF signal level is below the design threshold. Physical obstructions such as buildings, foliage, hills, tunnels, and indoor parking garages are usually the cause of coverage holes.

Cyclic Redundancy Check (CRC)

A common technique for detecting data transmission errors.

Dynamic Host Configuration Protocol (DHCP)

A protocol that assigns temporary IP addresses automatically to client stations logging onto an IP network, so the IP addresses do not have to be assigned manually. The ENH202 contains an internal DHCP server that automatically allocates IP address using a user-defined range of IP addresses.

Dead Spot

An area within the coverage area of a WLAN where there is no coverage or transmission falling off. Electronic interference or physical barriers such as hills, tunnels, and indoor parking garages are usually the cause of dead spots. See also coverage area.

802.11

A category of WLAN standards defined by the Institute of Electrical and Electronics Engineers (IEEE).

802.11a

An IEEE standard for WLANs that operate at 5 GHz, with data rates up to 54 Mbps.

802.11n

An IEEE standard for WLANs that operates at 2.4 GHz, with data rate of 300 Mbps. The new standard also raises the encryption bar to WPA2. The 40 HT option can be added to increase the data rate.

Encryption

Translates data into a secret code to achieve data security. To read an encrypted file, you must have a secret key or password for decryption. Unencrypted data is referred to as plain text; encrypted data is referred to as cipher text

ESS ID

The unique identifier for an ESS. All Access Points and their associated wireless stations in the same group must have the same ESSID.

Footprint

Geographical areas where an entity is licensed to broadcast its signal.

Gateway

A computer system or other device that acts as a translator between two systems that use different communication protocols, data formatting structures, languages, and/or architecture.

HT mode

In the 802.11n system, two new formats, called High Throughput (HT), are defined for the Physical Layer, Mixed Mode, and Green Field. If a system runs 40 HT, two adjacent 20 MHz channels are used. The larger 40 MHz bandwidth can provide better transmit quality and speed.

Keys

Like passwords, keys open (decrypt) and close (encrypt) messages. While many encryption algorithms are commonly known and public, the key must be kept secret.

Local-Area Network (LAN)

A small data network covering a limited area, such as a building or group of buildings. Most LANs connect workstations or personal computers. LANs let many users share devices such as printers as well as data. LANs also facilitate communication through e-mail or chat sessions.

Media Access Control (MAC) Address

Address associated with every hardware device on the network. Every 802.11 wireless device has its own specific MAC address. This unique identifier is hard-coded into the device and can be used to provide security for WLANs. When a network uses a MAC table, only the 802.11 radios that have their MAC addresses added to that network's MAC table can access the network.

Network Address Translation (NAT)

An Internet standard that lets a LAN use one set of IP addresses for internal traffic and a second set of addresses for external traffic.

Network Time Protocol (NTP)

A protocol that lets devices synchronize their time with a time server. NTP uses TCP or UDP port 123 by default.

Passphrase

A text string that automatically generates WEP keys on wireless client adapters.

Power Over Ethernet (PoE)

A PoE provides power to PoE-enabled devices using an 8-pin CAT 5 Ethernet cable, eliminating the need for a power source.

Preamble

Synchronizes transmissions in a WLAN. The preamble type defines the length of the Cyclic Redundancy Check block for communication between a device and roaming wireless stations.

Protected Extensible Authentication Protocol (PEAP)

Authentication protocol of IEEE 802.1x used to send authentication data and passwords over 802.11 WLANs.

Quality of Service (QoS)

A network’s ability to deliver data with minimum delay. QoS also refers to the networking methods used to provide bandwidth for real-time multimedia applications.

Remote Authentication Dial-In User Service (RADIUS)

Networking protocol that provides centralized authentication, authorization, and accounting management for computers to connect and use a network service. Because of its broad support and ubiquitous nature, the RADIUS protocol is often used by ISPs and enterprises to manage access to the Internet or internal networks, WLANs, and integrated e-mail services.

Service Set Identifier (SSID)

Name of a WLAN. All wireless devices on a WLAN must use the same SSID to communicate with each other.

Simple Network Management Protocol (SNMP)

An Internet-standard protocol for managing devices on IP networks.

Snooping

Passively watching a network for data, such as passwords, that can be used to benefit a hacker.

Temporal Key Integrity Protocol (TKIP)

An encryption protocol that uses 128-bit keys. Keys are dynamically generated and distributed by the authentication server. TKIP regularly changes and rotates encryption keys, with an encryption key never being used twice.

Transmission Control Protocol/Internet Protocol (TCP/IP)

A protocol that allows communications over and between networks. TCP/IP is the basis for Internet communications.

Weighted Fair Queuing (WFQ)

WFQ services queues are based on priority and queue weight. Queues with larger weights get more service than queues with smaller weights. This highly efficient queuing mechanism divides available bandwidth across different traffic queues.

Wired Equivalent Privacy (WEP)

Security protocol that provides a WLAN with a level of security and privacy comparable to that of a wired LAN. WEP encrypts data sent between wired and WLANs to keep transmissions private.

Wireless Local-Area Network (WLAN)

WLANs use RF technology to send and receive data wirelessly in a certain area. This lets users in a small zone send data and share resources such as printers without using cables to physically connect each computer.

Wi-Fi Protected Access (WPA)

A subset of the IEEE 802.11i standard. WPA applies IEEE 802.1x and Extensible Authentication Protocol (EAP) to authenticate wireless clients using an external RADIUS database. WPA uses Temporal Key Integrity Protocol (TKIP), Message Integrity Check (MIC), and IEEE 802.1x to encrypt data. See also WPA-PSK (WPA -Pre-Shared Key).

Wi-Fi MultiMedia (WMM)

Part of the IEEE 802.11e QoS enhancement to the Wi-Fi standard that ensures quality of

service for multimedia applications in WLANs.

Wireless Client Supplicants

Software that runs on an operating system, instructing the wireless client how to use WPA.

WPA -Pre-Shared Key (WPA-PSK)

WPA-PSK requires a single (identical) password entered into each Access Point, wireless gateway, and wireless client. A client is granted access to a WLAN if the passwords match.

WPA2

A wireless security standard that defines stronger encryption, authentication, and key management than WPA. It includes two data encryption algorithms, Temporal Key Integrity Protocol (TKIP) and Advanced Encryption Standard (AES), in the Counter mode with Cipher block chaining Message authentication Code Protocol (CCMP).

Wireless Distribution System (WDS)

A technology that lets Access Points communicate with one another to extend the range of a WLAN.

Appendix D – Statements of Conformity

D.1 – Federal Communication Commission Interference Statement

This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one of the following measures:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult the dealer or an experienced radio/TV technician for help.

FCC Caution: Any changes or modifications not expressly approved by the party responsible for compliance could void the user's authority to operate this equipment.

This device complies with Part 15 of the FCC Rules. Operation is subject to the following two conditions: (1) This device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

IMPORTANT NOTE:

Radiation Exposure Statement:

This equipment complies with FCC radiation exposure limits set forth for an uncontrolled environment. This equipment should be installed and operated with minimum distance 20cm between the radiator & your body.

This transmitter must not be co-located or operating in conjunction with any other antenna or transmitter.

Note: Country selection is not available in the US model.

D.2 – Industry Canada Statement

This device complies with RSS-210 of the Industry Canada Rules. Operation is subject to the following two conditions: (1) This device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

Ce dispositif est conforme à la norme CNR-210 d'Industrie Canada applicable aux appareils radio exempts de licence. Son fonctionnement est sujet aux deux conditions suivantes: (1) le dispositif ne doit pas produire de brouillage préjudiciable, et (2) ce dispositif doit accepter tout brouillage reçu, y compris un brouillage susceptible de provoquer un fonctionnement indésirable.

IMPORTANT NOTE: Radiation Exposure Statement:

> This equipment complies with IC radiation exposure limits set forth for an uncontrolled environment. This equipment should be installed and operated with minimum distance 20cm between the radiator & your body.

NOTE IMPORTANTE: (Pour l'utilisation de dispositifs mobiles):
Déclaration d'exposition aux radiations:
Cet équipement est conforme aux limites d'exposition aux rayonnements IC établies pour un environnement non contrôlé. Cet équipement doit être installé et utilisé avec un minimum de 20 cm de distance entre la source de rayonnement et votre corps.

D.3 – Europe Declaration of Conformity

This device complies with the essential requirements of the R&TTE Directive 1999/5/EC. The following test methods have been applied in order to prove presumption of conformity with the essential requirements of the R&TTE Directive 1999/5/EC:

- EN60950-1:2006 A11:2009
  Safety of Information Technology Equipment

- EN50385 : 2002
- Generic standard to demonstrate the compliance of electronic and electrical apparatus with the basic restrictions related to human exposure to electromagnetic fields (0 Hz - 300 GHz)

- EN 300 328 V1.7.1: 2006-10
- Electromagnetic compatibility and Radio spectrum Matters (ERM); Wideband Transmission systems; Data transmission equipment operating in the 2,4 GHz ISM band and using spread spectrum modulation techniques; Harmonized EN covering essential requirements under article 3.2 of the R&TTE Directive
-
  EN 301 489-1 V1.8.1: 2008-04
  Electromagnetic compatibility and Radio Spectrum Matters (ERM); ElectroMagnetic Compatibility (EMC) standard for radio equipment and services; Part 1: Common technical requirements

- EN 301 489-17 V2.1.1 2009-05
- Electromagnetic compatibility and Radio spectrum Matters (ERM); ElectroMagnetic Compatibility (EMC) standard for radio equipment and services; Part 17: Specific conditions for 2,4 GHz wideband transmission systems and 5 GHz high performance RLAN equipment

This device is a 5 GHz wideband transmission system (transceiver), intended for use in all EU member states and EFTA countries, except in France and Italy where restrictive use applies.

In Italy the end-user should apply for a license at the national spectrum authorities in order to obtain authorization to use the device for setting up outdoor radio links and/or for supplying public access to telecommunications and/or network services.

This device may not be used for setting up outdoor radio links in France and in some areas the RF output power may be limited to 10 mW EIRP in the frequency range of 2454 – 2483.5 MHz. For detailed information the end-user should contact the national spectrum authority in France.
